A petrographic, lithologic and stratigraphic investigation was carried out at the confluence of the Podkamennaya Tunguska with the Yenisev. The results allow an hypothesis that the accumulations of pebbles and alluvium occurring at various levels of the banks are remnants of pre-glacial and glacial hydrographic systems. These systems are tentatively reconstructed and shown on text map.

45731. TUDIN. I. Polet bolida. (Ogonëk, Apr. 1956, god 34, no. 17, p. 31, illus.) Text in Russian. Title tr: The flight of a bolide.

Note on the brilliant meteorite observed in Middle and Northern Ural on Feb. 1, 1956. Copy seen: DLC.

45732. IUDIN, M. N., and S. A. ILLA-RIONOV. Iz opyta skarmlivanifa tfuleniny pushnym zveríam. (Karakulevodstvo i zverovodstvo. May-June 1956. god 9, no. 3, p. 43-44, tables.) Text in Russian. Title tr.: From an experiment in feeding fur animals with seal meat.

Information is offered on feeding foxes and mink with this meat, which originated in Arkhangel'sk and subsequently was frozen for storage. At the start, the meat was given in small portions to a limited number of animals only, and in all cases trimmed of excess fat and washed. The nutritive and economic aspects of the trial are discussed. Copy seen: DLC.

45733. IUFEROV, V. Zaderzhanie snega i talykh vod v kolkhozakh Sibiri. (Kolkhoznoe proizvodstvo, Nov. 1955. god 15, no. 11 (174), p. 28-29, illus.) Text in Russian. Title tr.: Retention of snow and meltwater in Siberian kolkhozes.

"Examples of the importance of snow retention to the agriculture of the steppe and forest-steppe regions of Siberia are given on the basis of observations made in 1952-1954. Soil freezing during the severe winter of 1952-53 reached 2.25 m. beneath a snow cover less than 10 cm. Snow retention, which increased snow depth to 60-70 cm., diminished soil freezing to 80 cm. Complete thawing occurred 25 days earlier than usual. Sunflower, mustard, and other high-growing crops were considered best for drift control when sown perpendicular to the prevailing wind in rows not farther apart than 10-15 times the height of the plant."-SIPRE. Movement of snow and water may be restricted also by a special arrangement of shields built of lumber and tree branches on snowbank.

Copy seen: DLC.

45734. IVANOV. TURII. V. kratere delstvufushchego vulkana. (Ogoněk, Oct. 1956. god 34, no. 42, p. 14-16, illus., port.) Text in Russian. Title tr.: In the crater of an active volcano.

Story and photos of author's trip with another alpinist, V. Milovanovich, up the Avachinskaya Sopka, and their descent (200 m.) to the bottom of the crater, Aug. 18, 1956(?). Copy seen: DLC.

45735. IVANOV, TURII. Zimufushchie lebedi. (Okhota i okhotnich'e khozfalstvo, Dec. 1956, no. 12, p. 41-43, illus.) Text Title tr.: The wintering in Russian. swans.

Describes a winter dog-sledge trip in Kamchatka and encounter with swans wintering on small ice-free lake in vicinity of the hot spring Chernyy Klyuch.

45738. IVANOV, SERGEĬ VASIL'E-VICH, and others. Nanatsy. (In: Akademiñ nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 783-816, illus. plates.) 24 refs. Text in Russian. Other authors: M. G. Levin and A. V. Smoliūk. Title tr: Nanatsy.

Gives a general outline of the archeology and history of the Amur River basin, Okhotsk Sea littoral and Sakhalin, and of the population, i. e. the Paleo-siberian Nivkhi (Gilyaks) and Tungus-Manchurians: Nanatasy (Golds), Negidal'tay,

Orochi, Oroki, Udėgeitsy, and Ul'chi. Each group is treated individually (No. 45739-45744); comparisons of cultures made throughout. and customs are The territorial distribution of the Golds (approx. 48°-51° N.), population within the Soviet Union (5,757 in 1926), tribal names, linguistic and racial affiliations, trade and cultural relations with Russians and Chinese are discussed. Their native culture is described: hunting and fishing economics, agriculture, arts and crafts (iron artifacts and armor), means of travel (draught dogs, sledges and skis, flat-bottomed boats, dugouts and sailboats), summer and winter housing (bark and reed huts, tents, mud houses, frame and log cabins, barns on piles, etc.), furnishings (strong Chinese influence), clothing (animal and fish skins, Chinese silk), food, social conditions (slavery, exogamy, levirate), folklore and religious beliefs (shamanism, animism, tiger cult, burial customs, etc.). The changes in the post-Revolutionary period are dealt with: kolkhozes (started in 1930), motorized fishing stations (MRS), expansion of agriculture, introduction of gardening and agriculture, education, health serv-Modern native artists, writers ices, etc. and scientists are named and some of their works cited. The description of the pre-Revolutionary period is based on an unpublished (?) article by the late N. A. Lipskafa. Copy seen: DLC.

45739. IVANOV SERGEĬ VASIL'E-VICH, and others. Negidal'tsy. (In: Akademiña nauk SSSR. Institut êtnografii. Narody Sibiri, 1956, p. 776-82, illus.) 13 refs. Text in Russian. Other authors: M. G. Levin, A. V. Smolfâk. Title tr.: The Negidals.

Describes the pre-Revolutionary history, customs and material culture of this small Tungus group (426 in 1926) living along the Amgun' and Amur Rivers. The cultural and economic changes, kolkhozes, etc., under the Soviet regime are discussed, as in No. 45738.

Copy seen: DLC.

45740. IVANOV, SERGEĬ VASIL'E-VICH, and others. Nivkhi. (In: Akademiâ nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 861-84, illus.) 21 refs. Text in Russian. Other authors: M. G. Levin and A. V. Smolâk. Title tr: Gilyaks.

Deals (as in No. 45738) with the preand post-Revolutionary culture and customs of this Paleo-Siberian group. The Gilyaks inhabit the lower Amur River region, and the island of Sakhalin. They numbered 4076 in the U. S. S. R. (1926 census): 2376 on the mainland, 1700 on northern Sakhalin; and 111 on southern Sakhalin in 1928. The description of the pre-Soviet period is based on an unpublished (?) article by A. M. Zolotarev. Copy seen: DLC.

45741. IVANOV, SERGEĬ VASIL'E-VICH, and others. Orochi. (In: Akademifā nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 844-54, illūs.) 17 refs. Text in Russian. Other authors: M. G. Levin and A. V. Smolfāk. Title tr: Orochis.

Describes the linguistic and racial affiliations of this small Tungus group (405 in 1926) living mainly near the Tumnin River estuary (approx. 48° N. 140° E.). Their pre- and post-Revolutionary culture and customs are discussed as are those of the Golds (No. 45738). The description of the pre-Revolutionary period is based on an unpublished (?) article by B. A. Vasil'ev.

Copy seen: DLC.

45742. IVANOV, SERGEĬ VASIL'E-VICH, and others. Oroki. (In: Akademiiâ nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 855-60, illus.) 17 refs. Text in Russian. Other authors: M. G. Levin and A. V. Smoliâk. Title tr.: Oroki.

Sketches (as in No. 45738) the material culture and customs (before and after the Russian Revolution) of this small Tungus group inhabiting Sakhalin. According to the 1926 census, 162 lived in the northern part of the island, approx. 300 in the southern. The description of the pre-Revolutionary period is based on an unpublished (?) article by B. A. Vasil'ev.

Copy seen: DLC.

45743. IVANOV, SERGEĬ VASIL'E-VICH, and others. Udėgelisy. (In: Akademiâ nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 831–43, illus.) 9 refs. Text in Russian. Other authors: M. G. Levin and A. V. Smoliâk. Title tr.: Udegeitsy.

Describes (as in No. 45738) the material culture and customs of this southern Tungus group (1357 in 1926) in pre- and post-Revolutionary times. They live on both slopes of the Sikhote-Alin' mountain range (approx. 43°-52° N.) along the Sea of Japan.

Copy seen: DLC.

45744. IVANOV, SERGEĬ VASIL'E-VICH, and others. Ul'chi. (In: Akademiā nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 817–30, illus. incl. plate.) 18 refs. Text in Russian. Other authors: M. G. Levin and A. V. Smoliāk. Title tr.: Ul'chi.

Deals with the material culture and customs of this Tungus group, as with the Golds (No. 45738). The Ul'chi, 758 in 1926, have lived along the Amur River (approx. 48°30′ N. 135° E. 52°30′ N. 140° 30′ E.) during the pre- and post-Revolutionary period. Polygamy and marriage to father's sisters and mother's brothers were practiced up to the 20th century. The description of the pre-Revolutionary period is based on an unpublished (?) article by A. M. Zolotarev. Copy seen: DLC.

IVANOV, SERGEĬ VASIL'EVICH, see also Potapov, L. P. Istoriko-ėtnograficheskil ocherk russkogo naselenifa Sibiri... 1956. No. 47433.

45745. IVANOV, V. N. Radio. (In: Obruchev, S. V. Spravochnik puteshestvennika, t. 1, 1949. p. 525–50, illus. tables.) 7 refs. Text in Russian. Title tr.: The radio.

Contains basic information on radiocommunication: radio-waves and their propagation; transmitters and receivers, their installation, operation and repair. Data on main Soviet transmitters and dry cells are given (p. 532-37). Soviet broadcasting stations, including Arkhangel'sk, Murmansk, Petropavlovsk-on-Kamchatka and Yakutsk, are listed with wave length. Copy seen: DLC.

45748. IVANOVA, EVGENIA NIKO-LAEVNA. Sistematika pochv severnor chasti evropeřskoľ territorii SSSR. (Pochvovedenie, Jan. 1956, no. 1, p. 70–88.) 18 refs. Textin Russian. French summary in insert. *Title tr:* Systematics of soils of the northern part of the European territory of U. S. S. R.

Discussion of the principles of classification of northern soils, based on Soviet literature, proceedings of the Conference of Pedologists, Dec. 7-14, 1954, and on the investigation of northern soils of the U. S. S. R. carried out by the Soil Institute (Pochvennyl institut im. V. V. Dokuchaeva) of the Academy of Sciences. It is proposed to divide the soils of the North, from arctic to northern forest-steppe, into 13 types (p. 75). Features of arctic and tundra soils and their classification into subtypes are briefly outlined (p. 76-79). Copy seen: DLC.

45749. IVANOVA, V. A. Klass Crustacea – rakoobraznye. (In: Leningrad. Vsesoûznyî geologicheskiî institut. Polevof atlas ordovikskoî i silurifskof fauny Sibirskof platformy, 1955. p. 105–116, illus.) Text in Russian. Title tr: Class Crustacea.

A description of the only order represented in the Siberian platform: the Ostracoda, their anatomy, taxonomy, occurrence as fossils, collection, etc. Subsequently 18 forms are treated in turn (eight of them new) including morphology, size, occurrence, etc. Copy seen: DLC.

IVANOVA, V. A., see also Nefskafa, A. I., and V. A. Ivanova. Pervafa nakhodka ostrakod . . . 1956. No. 46989. IVARSSON, REINHOLD, see Haglund, B. Den levande skogen . . . 1955. No. 45380.

45750. IVERSEN, MOGENS. Biblioteker i Grønland. (Grønland, Aug. 1956, nr. 8, p. 295-99, illus.) Text in Danish. *Title tr:* Libraries in Greenland.

Describes plans for setting up a public library service in Greenland, supplying books in both Danish and Greenlandic; a considerable government grant was made for it in 1956. A Danish picture and children's book collection has been placed in 16 schools. Libraries should be built in Godthåb, Julianehåb, Egedesminde and Holsteinsborg and other places served by circulating libraries. Existing book collections are noted.

Copy seen: DLC.

45751. IVES, JOHN DAVID. Geomorphological and glaciological investigations in the Torngat Mountains of northern Labrador. (Arctic, 1956. v. 9, no. 3, p. 213–14.)

Describes field work by the author and his wife during July-Sept. 1956 at Upper Kangalaksiorvik Lake inland from Seven Islands Bay (approx. 59°24′ N. 63°50′ W.), at Lower Komaktorvik Lake, 20 mi. south, and in the Abloviak Fiord region on the Ungava Bay side of the peninsula (59°30' N. 65°25' W.). Author concludes that even the highest summits were deeply submerged by continental ice at the height of the ice age. At least two The Tornmajor glaciations occurred. gats do not appear to have been either a "source" area or region of final dispersal of continental ice. Copy seen: DLC.

45752. IVES, JOHN DAVID. A preliminary report on geomorphological investigations in the Torngat Mountains of northern Labrador, with particular emphasis upon the Quaternary glaciations, July-September 1956. [Montreal?], 1956. 18 p. 8 illus. Mimeographed. 19 refs.

The author, assisted by P. Ives, investigated a 600-sq. mi. area in the "central range" of the Torngats, with base camp near Seven Islands Bay (59°10′ N. 64° W.). General geology and physiography are briefly described. Extent of the Wisconsin glaciation, direction of ice movement, and late-Wisconsin conditions are discussed. Author concludes that highest summits were completely submerged by eastward-moving ice at the height of the Wisconsin; local glaciers never reached significant dimensions; final ice movement

was from the west; rapid melting in situ of large ice masses occurred during final stages of Wisconsin; two, possibly three, glacial periods can be recognized; the Labrador-Ungava plateau rather than the Torngats was initial accumulation area in the continental glaciation.

Copy seen: CaMAI.

45753. IVES, JOHN DAVID. Till patterns in central Labrador. (Canadian geographer, 1956. no. 8, p. 25–33, 4 illus.,

2 text maps.) 8 refs.

Describes an area of "rippled till" about 45 mi. southeast of Knob Lake in the upper Ashuanipi River basin. Undulations of the till plain form sub-parallel ridges 150-200 paces wide at one-sixth to one-quarter mi. intervals, with southwestnortheast alignment at right angles to that of the drumlins and eskers. Several small areas are described. Numerous pits dug to depths of ten ft. revealed nonsorted, medium to coarse-grained sand, with an irregular cover of ablation moraine. Ripples are closely associated with a large esker and probably formed contemporaneously with it. No satisfactory explanation for origin of the till pattern has been found. Copy seen: DGS.

45754. IVES, RONALD L. An early speculation concerning the Asiatic origin of American Indians. (American antiquity, Apr. 1956. v. 21, no. 4, p. 420–21.) 4 refs.

Discusses various theories concerning the origin of American Indians and points out that the hypothesis of a migration from northern Asia existed in the 18th century or even earlier, as Father Ignaz Pfefferkorn in his Beschreibung der Landschaft Sonora . . . Köln, 1794–95 (copy in DLC) refers to an earlier treatise on this subject.

45759. JACOBSON, J. V. New educational programme for the Northwest Territories. (Northern Affairs bulletin, Feb.—Mar. 1956. v. 3, no. 2, p. 11-14, illus.)

Canadian (federal) Government is responsible for education of Eskimo and Indian children, the Territorial Government for others. Less than 40 percent of

native children attend school regularly. Growth of population and decline of game and fur resources necessitates their education for other than traditional occupations. Plans are described for expanding schools and building hostels to board children, the hostels, built by Government, to be turned over to Roman Catholic and Anglican churches. Aklavik, Fort Simpson, Yellowknife, Fort Smith, Fort McPherson, and Frobisher Bay are proposed sites; a 250-pupil hostel at Aklavik is sketched. Copy seen: CaMAI.

JANELID, INGVAR. 45764. Drilling and blasting equipment and methods in Swedish mines. (Canadian mining journal, Dec. 1956. v. 77, no. 12, p. 71–76; Jan. 1957, v. 78, no. 1, p. 60–65, illus., diagrs., graphs.) 20 refs.

Deals with practices in iron ore mines, the northernmost: Kiruna and Malmberget. Almost all production will be by underground operations by 1960, when open-pit mining ends at Kiruna. Methods have been developed to deal with very hard ore and waste rock conditions and steeply dipping orebodies. Drilling and blasting techniques are described; planning principles, mining operations, loading, haulage, primary crushing underground, and hoisting, etc., are explained, and exemplified from Kiruna and Malmberget among other mines. Future developments are predicted.

Numero special 1F, La mine future, p. 76-100, illus., diagrs., graph.) 20 refs. Text in French. Title tr.: Equipment and methods in use in modern mining operations in Sweden.

Includes brief description of underground mining methods, machines used, and underground transport of iron ore at Kiruna and Malmberget, northern Sweden, with photographs and diagrams of equipment and installations.

Copy seen: DGS.

45766. JANSEN, J. VICTOR. The life of the Eskimos; an educational exhibition at the Museum voor Land- en Volkenkunde in Rotterdam. (Antiquity and survival, May 1955, nr. 1, p. 83-92, illus.,

diagrs., text map.)

Contains a general discussion of various aspects of Eskimo life as introduction to the exhibition opened January 1955, of ethnographical objects and models in appropriate grouping, supplemented by photographs, drawings and sketches. The dwelling, food supply, and transportation are mainly discussed. A map of Eskimo territory is included.

Copy seen: DLC.

JANSSEN, GÜNTER. 45767. Störungen der Thermoregulation und endogene Hypothermie. (Monatsschrift für Kinderheilkunde 1956. Bd. 104, Heft 12, p. 478-80, illus.) 10 refs. Text in Title tr.: Disturbances of German. thermoregulation and endogenous hypothermia.

Following an introduction on endogenous hyperthermia and the very rare endogenous hypothermia, the author presents three of the latter cases, all in children less than 18 months old, with tubercular meningitis. Hypothermia varied between 27 and 34.5° C. One case thoroughly examined showed upon autopsy calcified, vegetative nerve cells in the hypothalamus.

45769. JANSSON, JAN ERIK. breakers and their design. (European shipbuilding, Oslo, 1956. v. 5, no. 5, p. 112-28; no. 6, p. 143-51, diagrs., illus., map, tables) 36 refs.

The characteristics of sea ice in polar and temperate regions are outlined; the development of ice-breakers is reviewed, and the designs of modern cargo and passenger-carrying ice-breakers as well as those built for research purposes are treated in detail. The mechanics of ice breaking at constant speed and in bursts, model experiments in ice breaking, and the work of ice-breakers in pack ice are discussed. The structural features of ice-breakers are examined individually, including hull form, diesel-electric machinery, and adjustable-blade propellers. The results of model experiments on the resistance and speed of ice-breakers with two stern propellers but without fore propellers and of calculations of the wake fraction and thrust-deduction coefficient are given. The design requirements for fore propellers, and longitudinal hull strength, shell plating, and transverse- and local-strength requirements are considered. The equipment and accommodations of modern ice-breakers are described. Data are tabulated on the design characteristics of ice-breakers built in various countries since 1890, of model ice-breakers, and the thickness of hull plating in the ice zone amidship and in the fore body of selected vessels.

Polemic against Christian Vibe's article on problems of the Greenland musk ox (No. 43166), Jennov contends that West Greenland can feed about 90,000 animals (Vibe: 10,000-12,000), and that the reduction of musk ox cows is not due to excessive hunting but solely to climatic conditions.

Musk ox and reindeer capacity of northern Greenland are considered with respect to vegetative area, climate, natural enemies, disease and hunters. Slow renewal of overgrazed areas is stressed, and, especially decimation of animals during the winters (infrequent) when icing prevents grazing. Since 1823, when the last East Greenland Eskimos were seen, the numbers of musk ox and reindeer have varied largely with natural conditions. Jennov's views are discussed by A. Pedersen, q. v.

45784. JENSEN, ARNE. Component sugars of some common brown algae. Oslo 1956. 8 p. diagr., 3 tables. (Norsk institutt for tang- og tareforskning. Report no. 9) 9 refs. Summary in Norwegian.

Component sugars of spring and autumn collections of 12 species of brown algae from Reine, Lofoten, Norway, were identified. All the hydrolysates investigated contained complex mixtures of monosaccharides, the latter being identified by paper partition chromotography. Results of the examination are tabulated separately for the seasonal collections. A brief discussion of the consequences of the presence of interfering sugars on the laminarin analysis is given.

45788. JENSEN, ORLA BRANDT. Indkomstforholdene i Grønland. (Grønland 1953, hefte 7, p. 247-53, illus., tables.) Text in Danish. Title tr.: Income levels in Greenland.

Prices for fishing and hunting products and those for equipment are compared for 1939-40, 1949-50 and 1953. Over the whole period, sales prices of Greenland products have risen more than purchase prices of equipment; but from 1949-50 onwards the data are less decisive and developments possibly less favorable for the producers. The producers are considered to have benefitted from the increase in production by a higher standard of living. Production has, however, been stagnant since the end of the 1940's. Increase of wages and salaries of government employees in Greenland is shown for the same years. All personnel except the Danish officials have received increases equivalent to more than the rise in cost of living. The Danish officials' salaries have risen relatively less as they are regulated according to price changes in Denmark. Copy seen: DLC.

45792. JESS, ARTHUR. Some aspects of ground-ice control on Alaskan highways. (In: Alaskan Science Conference. . . 1952. Proceedings, pub. 1954, p. 25–26.)

The various forms of ground ice which affect the normal maintenance of roads in Alaska and their control are described. Ground icings, which form from the seepage of ground water into sidehill cuts and build into the roadway, are the greatest hazard to traffic. One method of controlling this type of ice formation consists in placing a canvas fence supported by poles between the seepage and the road, thus diverting the flow parallel to the road. Icing from rivers may be prevented by building snow banks on the ice across the river and near rapids above the road crossing, and by chopping a hole through the ice to drain the water. Where roads are not kept open in winter and icings are allowed to form, they may reach a thickness of more than 20 ft. and cover a section of the road more than 1000 ft. in length. The removal of the ice in spring is achieved by blasting, ripping, and cutting. Sprinkling of coal dust, dirt, ashes, or salt has proved effective in accelerating thawing.

**45793. JESSIMAN, E. G.** Trimetrogon mapping. (Canadian surveyor, Jan. 1956. v. 13, no. 1, p. 12–15.)

Improvements in trimetrogon plotting employed by the Canadian Dept. of Mines and Technical Surveys since 1949 are discussed briefly. The method employs three cameras in constant angular relationship for aerial photogrammetry Flight lines were run straight north and south, 16 mi. apart, in the far North in order to compensate for lack of horizontal control. Lateral ties to these rims should be particularly effective when plotting Ellesmere Island since many large snow fields break or weaken the normal north-south flight lines. More than two million square miles have been plotted to date. Copy seen: DLC.

45794. JESSON, EDWARD R. From Dawson to Nome on a bicycle. Edited by Ruth Reat. (Pacific Northwest quarterly, July 1956. v. 47, no. 3, p. 65–74, 2 illus., port.) ref.

Contains extract from Edward R. Jesson's Alaska diary and from a letter of Sept. 25, 1900 in possession of the editor. Jesson arrived in Kenai Peninsula, in 1896, and went to the Yukon during the gold rush of 1898. In 1899 he operated a small store and post office at Star City, 120 miles down the Yukon from Dawson, and during Mar. 1-29, 1900, made a bicycle trip to Nome, where the gold rush was on. This diary records the trip with comments on advantages of bicycle over dog team. Jesson returned

to Dawson at the time of the strike in the Tanana field. Copy seen: DGS.

Puccinia blyttiana Lagh. was found on Ranunculus affinis R. Br. in Tempelfjord at 78°24′ N. in the course of the Norsk Polarinstitutt's scientific expedition to Svalbard in 1948. This is the first known occurrence in the Arctic of the rust commonly associated with the American Rockies but otherwise widely and sparsely distributed. Misidentifications and priority of names of this and similar rusts are clarified.

Summary of interests leading to the unified scientific studies of the First and Second International Polar Years. Some of the stations set up by participating nations and special fields of investigation are described. The program of the IGY 1957-58 is characterized by its global scope, use of recently developed equipment and techniques, wider participation, and concerted observations on special days. International teams, and

stations on major land sites and floating ice are involved in the investigations in the Arctic.

45801. JOHANSEN, HANS CHRISTIAN, 1897- . Polarraeven på Kommandørøerne. (Naturens verden, 1950. Årg. 34, p. 37-59, 9 illus., text map.) Text in Danish. *Title tr.:* The polar fox on the Commander Islands.

During wildlife studies on the Commander Islands, 1928-31, observation of the polar fox (Alopex beringensis) led to several important conclusions. Its recent decrease in numbers is due chiefly to the intestinal worm brought in by mice in ships' cargo. About 50 percent of each year's pups die during their first summer; most of them would survive if feeding conditions were good; but the critical period is summer when the feeding range is limited to the environs of the cub den. A program of supplemental feeding was initiated, utilizing waste products from local fisheries. Copy seen: DLC.

45802. JOHANSEN, HANS CHRISTIAN, 1897—. Revision und Entstehung der arktischen Vogelfauna, erster Teil: Einführung und Revision der Gaviae-Galli. København, Ejnar Munksgaard, 1956. 98 p. 9 maps. (Acta Arctica, fasc. 8.) 135 refs. Text in German. Summary in English. *Title tr.*: Revision and origin of the arctic bird fauna, part one: introduction and revision of Gaviae – Galli.

Contains discussion of the limits and subdivisions of the Arctic, and of geological data, followed by detailed consideration of Pleistocene glaciations and refuges, especially the last ice age, as factors of major importance in the problem of the origin of the arctic avi-The birds are divided into fauna. various categories ranging from higharctic to arctic-alpine; and within each of the arctic categories, according to their longitudinal distribution. An ecological division (sea-birds, land- and shore-birds) is also presented. following orders are analyzed and their origin discussed: Gaviae, Podicipedes, Tubinares, Steganopodes, Anseres, Accipitres and Galli, i. e. the ducks, geese, etc.,-gulls, terns, etc.

Among birds there is wide variation in mating, nestbuilding, and rearing of young. In an extended discussion, observations of certain shearwaters and puffins, the latter on the island of Røst in the Lofotens, are cited to show differences in parental action toward the young during the nesting period and when old enough to fly. The parents provide for the helpless young but leave them, when fledged, to fend for themselves. The young birds must learn to fly before they become too heavy.

45808. JOHNSON, FRED. Manitoba mining review. (Canadian mining journal, Feb. 1956. v. 77, no. 2, p. 92-93,

illus., text map.)

Value of mineral and crude oil production in 1955 totalled \$69,979,841. (1954: \$35,106,922), the increase in value of metal production due to Sherrit Gordon Mines at Lynn Lake (56°51' N. 101°03' W.) going into full production. Annual nickel production of 20,000,000 lbs. and 10,000,000 lbs. of copper is expected to begin by Mar. 1956; annual cobalt production is now 350,000 lbs. and fertilizer capacity is 70,000 tons. Two new orebodies have been located. Exploration for nickel in the Fox River (56°03' N. 93°18' W.), Mystery Lake (55°51' N. 97°44' W.), and Moak Lake (55°56' N. 97°31' W.) areas is briefly described. Copy seen: DGS.

45809. JOHNSON, FREDERICK ASH-BY, 1903— . Waterpower possibilities of Bradley Lake, Alaska. With a chapter on Tentative geologic conclusions on Bradley Lake power site, by Kenneth S. Soward. Washington, D. C., Jan. 1956. 85 p. 4 illus., 4 maps (3 fold.), 8 tables. Mimeographed. (U. S. Geological Survey. Reports, open file series, no. 376.) 3 refs.

Bradley Lake (approx. 59°45' N. 150°45' W.) and Bradley River in southwest Kenai Peninsula were investigated in July-Aug. 1955. Climate and hydrology are described (with tables of runoff records and climatic data); also factors that would affect operation of power plants such as sedimentation, ice on the reservoir, low winter temperatures. The reservoir site and its possible development are discussed in detail. Topographic and geologic conditions are favorable for creation of a large reservoir with a dam of moderate height. Power possibilities are estimated at 29,000 kilowatts 100 percent of the time with full utilization of estimated discharge. Development of the site will depend on creation of new industries.

45811. JOHNSON, HUGH ALBERT, 1913-, and R. J. COFFMAN. Land occupancy, ownership and use on homesteads in the Kenai Peninsula, Alaska, 1955. Palmer, Alaska, Nov. 1956. 31 p. 3 illus., 6 text maps, 19 tables. (Alaska. Agricultural Experiment Station, Bulletin 21) ref.

Results of a survey in summer 1955 covering all homesteads on the western side of the Peninsula, west of Chugach National Forest and Fox River at head of Kachemak Bay. Climate, soils, and vegetation are reviewed, also history of settlement since World War II. Data are given on: occupancy, ownership, and

utilization of the land; types of farms; homestead incomes and expenses, families and houses. Fifty-nine percent of all entered tracts were unoccupied in 1955, 37 percent were rural residences, and only four percent were farms. A more intensive study of the Homer area 1915–1955 disclosed that slow homestead development is associated with a general lack of stable and permanent settlement. Recommendations are made for changes in agricultural settlement policies, laws, taxes, aid to farmers, etc.

45813. JOHNSON, MARTIN WIGGO, 1893. The plankton of the Beaufort and Chukchi Sea areas of the Arctic and its relation to the hydrography. [Montreal] July 1956. 32 p. 11 text maps, 15 tables. (Arctic Institute of North America. Technical paper, no. 1) 44 refs.

Results of two oceanographic surveys by the U. S. Navy icebreaker Burton Island in Aug. 1950 and Aug.—Sept. 1951, during which 106 stations were occupied for plankton samples in the region 70°-76° N. 125°-170° W. In 1953, samples were obtained at 30 stations in Amundsen Gulf and Prince of Wales Strait. Faunas are considered in two parts: copepods, which constitute the greater part of the plankton; and miscellaneous plankton. The various species,

their abundance and distribution, and the hydrographic implications are dis-Data are tabulated. cussed. bution of several copepod species indicates flow of Bering Sea and Strait water to about 76° N. and around Pt. Barrow to western Beaufort Sea, also flow of surface water from Arctic Basin to Beaufort Sea. Numerically, the most important copepods are Calanus finmarchicus, C. hyperboreus, Metridia longa, Microcalanus pygmaeus, Oithona spp., Oncaea spp., and Pseudocalanus minutus. Copy seen: CaMAI.

45814. JOHNSON, O. Low level inversions over a snow surface. Ralston, Alta., Aug. 30, 1956. 4 l. 3 tables. (Canada. Defence Research Board. Suffield Experimental Station. Technical paper no. 103; DRB Project no. D52-32-01-04.) 4 refs.

Vertical temperature profile measurements, extending up to 1,000 ft. above terrain, were made during the winter of 1945–46 in the Suffield area. An analysis is made of these profiles to determine the frequency of occurrence of low level inversions and their conditions of occurrence. Results show that over a snow surface inversions persisted during the day on 45 out of 85 days of observations, and that it should be possible to forecast their occurrence with some degree of confidence.

45816. JOHNSTON, R. N., and G. A. HILLS. The need for rehabilitation of organic terrain in Ontario with special

reference to reforestation. (In: National Research Council of Canada. Associate Committee on Soil and Snow Mechanics. Proceedings of the Eastern Muskeg Research Meeting, Feb. 22, 1956. Ottawa, Oct. 1956. Technical memorandum, no. 42, p. 46-54, text map.)

One-third of Ontario is characterized by organic terrain: the Hudson-James Bay lowland, and the clay belt and till upland to the south of it. Forest and agricultural possibilities are discussed, also attempts (unsuccessful) at muskeg drainage, prospects (poor) of better conditions through geologic or climatic change or through removal of the peat. Fire is probably the best means of preventing spread of muskeg conditions, but more research is needed on its effects, also on characteristics of soils, climate, uses of peat, artificial drainage systems, etc.

45825. JONSGÅRD, ÅGE. On the growth of the fin whale, Balaenoptera physalus, in different waters; preliminary report from the State Institute for Whaling Research. (Norsk hvalfangstidende, 1952, no. 2, p. 57–76, illus., table) 11 refs. Also pub. in Norwegian.

11 refs. Also pub. in Norwegian.
Account of investigation, including size measurement, condition of gonads and general biological data of 295 fin whales landed between May 1 and Sept. 15, 1951, the hunting area including waters between the Finnmark coast and Bjørnøya. Size and growth data are compared with those of antarctic and other waters. It is concluded that while in external characters (color, relative size and position of organs, etc.) there is no essential difference between northern and antarctic fin whales, growth differences are so manifest as to rule out the possibility of northern animals migrating to the Antarctic and vice versa.

Copy seen: CaMAI.

45826. JONSGÅRD, ÅGE. Production of oil and meat from North Atlantic fin whales, Balaenoptera physalus. (Norsk hvalfangst-tidende, Oct. 1956. Årg. 45, nr. 10, p. 541-50, tables.) Text in

Norwegian and English.

The survey was carried out at three shore stations on the Norwegian coast each year 1951-1954, and the material comprised 189 whales in all. Average production of meat and oil and production from individual whales, male and female, are tabulated. The material is too small for a more exhaustive analysis but tentative conclusions are offered: production of meat and oil shows large individual variations in animals of the same sex and length, caught at the same time in the season. The oil yield tends to increase in the course of the season but weight of meat does not. Females suckling young are not a profitable catch. Copy seen: DA.

45827. JÓNSSON, JÓN. Cod, Greenland stock; the age distribution of Icelandic trawler-caught cod on Store Hellefiske Bank in 1954. (International Council for the Exploration of the Sea. Annales biologiques 1954, pub. 1956. v. 11, p. 93, table.)

Data collected from catches over three areas of this bank located off western Greenland (approx. 67° N. 56° W.). A rise in the 1947 year-class was noted towards the north, as well as a paucity in the 1945 year-class. Copy seen: DI.

45828. JÓNSSON JÓN, and U. STEFÁNSSON. Síldarrannsóknir "Aegis" sumarið 1954. Herring investigations with the research-vessel "Aegir" in the summer 1954. Ásamt lýsingu á síldarleitartaekjunum, eftir Kristján Júlíusson [with description of the herring-finding equipment, by Kristján Júlíusson]. Reykjavík, 1955. 41 p. illus., 8 text charts, diagrs., graphs. (Reykjavík. Háskolí Islands. Atvinnudeild. Fiskdeild. Fjölrit fiskideildar, nr. 5) Text in Icelandic. Summary in English.

In June-Aug. 1954, investigations of herring distribution and hydrographic conditions were carried out by Iceland University Research Institute, Dept. of Fisheries, in Denmark Strait and Greenland Sea to Jan Mayen. The research vessel was equipped with echo-sounding equipment, described by K. Júliusson (p. 3-6), for detecting herring shoals. Hydrographic conditions are reported, compared with those of 1953, and related

to herring distribution. Herring concentrations increased north of 67° N. (most abundant 67°-68° N.) and off the northwest coast of Iceland near boundary of the East Greenland Current. They were observed everywhere between Langanes and Jan Mayen, particularly where temperature changes were greatest. Dominant year classes were 1937, 1938, and 1943.

Contains discussion of the latitudinal variation of the energy balance of the earth-sea-air system based on a survey of radiation studies. An annual radiation surplus results in regions equator-ward from about 38° N. lat., and an annual deficit poleward from this circle (for the Northern Hemisphere). The quantities of energy needed to be transported poleward to maintain radiation equilibrium are established for this hemisphere, and the processes effecting the energy transfer are reviewed. The surface effects of heat transport in modifying temperatures are discussed, and the need for increased data coverage geographically as well as in time is indicated. *Copy seen:* DLC.

45841. JUUTINEN, PAAVO. Zur Biologie und forstlichen Bedeutung der Fichtenböcke (*Tetropium* Kirby) in Finnland. Helsinki, 1955. 112 p., 15 diagrs., 3 tables. (Acta entomologica fennica, no. 11.) 137 refs. Text in German. Summary in Finnish. *Title tr.*: On the biology of *Tetropium* Kirby and its importance in forestry in Finland.

Study of this genus of wood-destroying beetle, two species of which, T. castaneum and T. fuscum, are distributed in Finland, including Lapland, and cause dry rot in fir (Abies) trees. Breeding habits, development and feeding of these cerambycids are discussed. The eggs are laid in the bast and pupae develop in the rind of the tree. The life cycle of T. is one year in southern Finland and two years in the North. Unfavorable climatic conditions, certain parasites of beetles (especially Helcon aequator), also woodpeckers and the resistance of the tree itself are factors regulating the T. population. In all, these two species are not especially important themselves in the development of dry rot, but many other wood-destroying insects (20 listed, p. 88) follow T. and attack the diseased tree. Healthy forest conditions and early elimination of infected trees are the best means of protecting fir against these parasites.

45842. KACHADOORIAN, REUBEN, 1921— . Engineering geology of the Katalla area, Alaska. Washington, D. C. 1956. 22 p. 6 maps (5 fold.), graph. (U. S. Geological Survey. Reports, open file series, no. 395.) 3 refs.

Examination was made in summer 1955 of the Katalla segment of a proposed highway from Mile 39 on Copper River Highway to Icy Bay on the Gulf of Alaska. The region lies on the Gulf, southeast of Cordova, at approx. 60° N. 144°-145° W., on the south flank of the Chugach Mts. Topography and vegetation are described. Exposed bedrock consists of pre-Tertiary metamorphic and associated intrusive rocks and Tertiary sedimentary rocks. Unconsolidated Quaternary rocks, also described with regard to road location, include glacial outwash and moraine near present glaciers, and non-glacial terrace, beach and alluvial fan deposits, meadows, swamps, alluvial sand, and talus. Areas of large landslides and snowslides are noted. As the region lies in a major seismic zone, man-made structures should be earthquake-resistant. Copy seen: DGS.

45843. KACHADOORIAN, REUBEN, 1921- . Engineering geology of the Nenana-Rex area, Alaska. Washington, D. C., 1956. 21 p. 2 maps (1 fold.), graph. Photostat. (U. S. Geological Survey. Reports, open file series, no. 368.) 4 refs.

Geologic mapping of this Tanana valley area (64°12′30″-64°34′25″ N. 148°55′-149°17′40″ W.) was carried out in Aug. 1954, with emphasis on factors relevant to construction of Fairbanks-McKinley Park highway. Topography, drainage, and vegetation are briefly described. Bedrock consists of Precambrian Birch Creek schist and Nenana gravel of Tertiary age; unconsolidated glacial and non-glacial Quaternary deposits mantle the valley. These ma-

terials are evaluated (favorably) as highway foundations. Design of structures should allow for possible icing at stream crossings, also earthquake hazard as the area lies in a major seismic zone.

Contains results of a study carried out at the Polar-Alpine Botanical Garden at Kirovsk, Kola Peninsula. Mean monthly ground temperature is tabulated for the vear and for the vegetative season in hothouse and nursery; and data are shown (table 3) on the growth and development, in both places, of Berberis vulgaris, Caragana arborescens, Lonicera edulis, Rosa rugosa, etc., seedlings. Hothouse culture of decorative shrubs prior to planting them in the open was found to be an effective method of speeding their growth: they start to bloom early and continue to grow vigorously after transplanting even under prevailing northern conditions.

Contains analysis of a set of synoptic maps prepared by the TSentral'nyl institut pogody, the icebreaker Krasin, five arctic meteorological stations, and by observation posts on Vrangel Island. The origin of air masses, mechanism of atmospheric circulation, determination of character and position of the fronts affecting the weather in regions of the

of character and position of the fronts affecting the weather in regions of the East-Siberian and Chukchi Seas are emphasized. Analysis of the charts yields three types of synoptic processes. The first type is characterized by a long continued (sometimes ten days) effect of arctic air in the region of these seas moving along the southern periphery of the anti-cyclone. The second type is characterized by a basic process of transformation of air masses from the Arctic Basin into polar air above the northeastern Asiatic continent (Chukchi Sea, Bering Strait and Alaska). The third type occurs under the action of warm and

45861. KALITIN, NIKOLAĬ NIKO-LAEVICH, 1884–1949. What is to be expected from an actinometric program in the Arctic. Translated from Arctica, 1934, no. 2, p. 25–37. Ottawa, Aug. 1956. 11 l. diagrs. tables. (Canada. Defence Research Board. Directorate of Scientific Information Service. T 220 R) Translation by E. R. Hope of No. 8344 of Arctic Bibliography.

Expanded program of radiation measurements in the Arctic is urged. The Arctic, theoretically, receives more solar heating than any other region of the globe, at a certain season. To this time (1934), however, only one series exists of uninterrupted observations throughout an entire year in the arctic region, viz. Westman's observations in Spitsbergen. Some of the problems involved in determining the separate components of incoming radiation as well as the outgoing radiation are discussed.

Contains discussion of the genus, a key and descriptions of ten species. E. decipiens (Rovaniemi) E. signatus (Inari Lappmark), and E. falsus sensu mihi (Utsjoki, Inari Lappmark), are included.

Copy seen: DLC.

45871. KANGAS, MAUNO ESKO. Forstentomologische Studien an der Espe. (Suomen hyönteistieteellinen aikakauskirja, 1942. v. 8, no. 1, p. 49–71, 11 illus.) 14 refs. Text in German. *Title tr.*: Forest entomological studies of the aspen.

Reports results of an investigation of pests (chiefly beetles) causing dry rot in aspen species; it was carried out in Finland 1938-40, partly in the northern region. The 12 more important pests are listed, and the damage done by them or their

larvae is evaluated. Xylotrechus rusticus and Cryphalus bispinulus were found (fig. 8 & 9) on diseased aspens in the Rovaniemi region (66°32′ N. 25°53′ E.) in northern Ostrobottnia.

Contains a study of pests causing dry rot in ash, alder, willow, birch, etc., in Finland. The investigation includes the region around Rovaniemi (66°32′ N. 25°53′ E.) where three species of beetles, Cryptorrhynchidius lapathi, Saperda scalaris and Cossus cossus, have been found living on dying willow trees (figs. 4, 7, 8). The most injurious is C. lapathi which opens the way for other pests; C. coccus plays only a secondary role. Data on the biology of seven species of wood-boring bettles are added.

Copy seen: DLC.

Contains notes on material, tabulated characteristics of 12 species investigated, and distributional data on six of the beetles (text maps and lists of localities). X. hanseni, recorded in the Kuusamo region and Kemi Lapland, is included.

Copy seen: DLC.

45879. KANGAS, YRJÖ. Über das finnische Vorkommen des auffallenden Einwandererkäfers Lithocharis nigriceps Kr.; Col., Staphylinidae. (Suomen hyönteistieteellinen aikakauskirja, 1953. v. 19, no. 2, p. 71–83, 4 illus., 6 text maps) 12 refs. Text in German. Title tr.: On the Finnish occurrence of a striking immigrant beetle Lithocharis nigriceps Kr.; Col., Staphylinidae.

Contains data on the distribution and migration of this beetle, described first from Ceylon and common in India, southern China and Japan. Reported in Europe in 1944, it spread quickly throughout the continent. In Finland it was first reported in 1951, but some specimens were found in herbaria, collected in 1943. Presence of two species of Lithocharis is revealed: ochracea distributed in southern and central Finland up to 63° N., and nigriceps which came to southern Finland in 1938 and spread rapidly northward (four belts, maps 2-5). In 1951 it was recorded near Nordreisa in Troms fylke, approx. 69°30' N. Its migration routes are discussed, also the question of whether it is permanently established in arctic Scandinavia or only a chance visitor. Copy seen: DLC.

45880. KANNISTO, ARTTURI (JU-HA), 1874–1943. Wogulische Volksdichtung; bearbeitet und herausgegeben von Matti Liimola. Bd. 1: Texte mythischen Inhalts; Bd. 2: Kriegs- und Heldensagen. Helsinki, 1951, 1955. 2 v.: xlii, 483 p.; vi, 831 p. port., illus., map. (Suomalaisugrilaisen seura. Toimituksia 101, 109). Text in German. Title tr.: Vogul folklore; revised and edited by Matti Liimola. v. 1, texts of a mythical character; v. 2, tales of war and heroes.

Contains texts (in transliteration and German translation) of 136 myths, magic songs, prayers, etc., and 39 epic legends collected by Kannisto in 1901–1906 in the Vogul country along the left tributaries (Loz'va, Pelym, Tavda, Konda, Severnaya Sos'va) of the Tobol and lower Ob'

Rivers. The introduction by Liimola describes Kannisto's extensive work on the Vogul language and dialects, and gives an account of his travels and studies, the difficulties encountered in winning confidence and cooperation among the Voguls, data on the narrators, etc. Appended are commentaries on content of the texts, with names of narrators, linguistic parallels, and intonation curves.

Copy seen: DLC.

45881. KANWISHER, JOHN WILLIS, 1924— . How cold is a whale's tail? (Oceanus, Autumn and Winter 1956–57. v. 5, no. 1–2, p. 13–18, 2 illus., 2 diagrs.)

Popular account of author's investigations to determine regulation of temperature in whales. The blubber layer acts as effective barrier to heat loss over most of body, but flippers and tail are relatively uninsulated. Ways by which circulatory system conserves and discards heat are discussed. Author participated in whale hunt off the Norwegian coast to carry out tests on freshly-killed whales. *Copy seen:* DGS.

A portable snow remover, designed and built by the Gorky Automobile Works is described. It can be attached easily to the truck's bumper and driven by a shaft connected to the main engine through the gear box. Right and left hand screws, driven by the same shaft, collect and direct snow to the center of the scoop and to the suction of a large propeller wheel, which forces the snow aside. Snow one meter deep can be thrown 25-30 m. off the road. Average production of this arrangement is about 650 cu. m./ hr. Copy seen: DLC.

45888. KAPLIN, ALEKSEI ALEK-SEEVICH. Vo dvorîse pushniny. (Okhota i okhotnich'e khozısıstvo. Oct. 1956, no. 10, p. 22, illus.) Text in Russian. Title tr.: In the Fur-palace.

Report on the 27th International Fur Auction in Leningrad (in 1956?). Over four million skins of 45 species of furbearers were offered by the U. S. S. R.; 8,840 white (arctic) fox skins, 12,200 mink, over 14 thousand sable, over 800 thousand muskrat and about 1.3 million squirrel, were assembled from various areas, including the Pechora, Ob', Yenisey and Lena Rivers basins. Sale varied from 98 percent (squirrel) to 30 (white polecat) of the skins offered. The poor quality of the Soviet muskrat skins is noted.

Copy seen: DLC.

45889. KAPLIN, ALEKSEĬ ALEK-SEEVICH. Za vysokoe kachestvo sovetskoĭ pushniny. (Rafsionalizatšifa okhotnich'ego promysla, 1956. vyp. 5, p. 86-97, tables.) 3 refs. Text in Russian. Title tr.: Improve the quality of the Soviet furs.

In 1953, Soviet hunters delivered 130 million pelts to state organizations, as compared with yields of eleven million in the United States, seven million in Canada. Soviet furs are noted for their high quality, but the standard ought to be

raised by improvement in skinning and processing. Primary fur preparation and its improvement in various parts of the U. S. S. R., including Yakutia, Kamchatka, and the Pechora basin are discussed. The season for muskrat hunting is considered and data are given (p. 93) on the annual catch: it rose from 3,800 pelts in 1935 to 3,167,000 in 1952.

45892. KARANTONIS, F. É., and others. Ryby srednego techenii r. Leny. (Akademia nauk SSSR. lAkutski! filial, Yakutsk. Institut biologii, Trudy, 1956. vyp. 2, p. 3–144, illus. tables.) 55 refs. Text in Russian. Other authors: F. N. Kirillov and F. B. Mukhomediarov. Title tr: The fishes of the middle course of the Lena River.

A study of the river, the adjacent shore-lakes and some tributaries. Lena basin is characterized: its water and ice conditions; its various sections and course, its left tributary, the Vilyuy, and Lake Beloye. A general description is given of the fishes of these waters, their taxonomy, distribution and zoogeographic origin. The main part of the study (p. 23-110) deals with the morphology and biology of the commercial species, their occurrence and distribution, movements; propagation and development, food, catches, size and weight of fishes caught, economic value, etc. Finally (p. 110-30) the main fishing centers of the middle course of the river are examined: their location, kinds of fishes caught, etc.; general characteristics of the fisheries, reserves, economic value, etc. Appended is account of the benthos (108 forms) of the waters studied. The field work was sponsored by the Yakutsk Branch of the Academy of Sciences, and carried out during the summers 1948-1950, and the whole year of 1951. Four ichthyologists, two hydrobiologists, a chemist and an economist took part in the survey in addition to technicians, etc. The algae and plankton work was reported by L. E. Komarenko, q. v. 45897. KARLSTROM, THOR NELS VINCENT, 1920—. The problem of the Cochrane in late Pleistocene chronology. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 303–331, text map, fold. table. (U. S. Geological Survey, Bulletin 1021–J. A contribution to gen-

eral geology) 40 refs.

Age of the Cochrane ice advances in the region south of James Bay (approx. 50° N. 80° W.) is discussed in relation to the conflict between recent radiocarbon chronology and Antevs' North American varve chronology, with references to the literature 1928-1955. Glacioeustatic events in North America and northern Europe which can be correlated with the Cochrane are noted, also post-Cochrane bog records and climatic history in the two areas. U.S. Geological Survey analyses of four radiocarbon samples of peat and wood indicate that ice cover may have existed there from about 36,000 to 4500 B. C., that the Cochrane preceded the Altithermal climatic period (Thermal Maximum); it may be considered a Wisconsin event of sub-stage rank. Radiocarbon dates also support the correlation of the North American Mankato with the European Fennoscandian glacial substage, and the Cochrane with a post-Fennoscandian Copy seen: DGS. climatic event.

45898. KARO, H. ARNOLD. World coastline measurements. (International hydrographic review, May 1956. v. 33,

no. 1, p. 131-40.)

Figures for the shorelines of the world are tabulated. Mainland measurements and those of larger islands are considered reasonably accurate within 5-10 percent. Values in statute miles for selected areas are as follows: Greenland: 8,650; Alaska: 6,640; Canadian northern coast: 6,400, Arctic Islands: 16,605; Svalbard: 1400; Jan Mayen: 65; Iceland: 1,400; the arctic coast of U. S. S. R.: 10,850; also specified islands.

Brief account of Peary's life (1856–1920), his arctic expeditions and attainment of the North Pole, Peary's stubborness and perseverance in his undertakings are stressed; his aides (R. A. Bartlett, and others) are characterized; his scientific achievements are summarized (p. 38). Copy seen: DLC.

45901. KARPOV, VIKTOR PAVLO-VICH. Stroitel'nye raboty pri prokladke gazoprovodov. Izd. 2, perer. i dop. Moskva, Izd-vo Ministerstva kommunal'nogo khozûâlstva RSFSR, 1954. 144 p. illus., diagrs. refs. Text in Russian. Title tr: Construction work in laying

gas mains.

Includes as final chapter, Zimnie raboty na trasse: Winter pipe-laying (p. 127-43), in which pipe-laying procedures and the effects of ground freezing on gas pipeline operation are described in detail. Various methods of thawing are explained, using steam, hot water, electric current, hot air or gas, quick-lime and thermo-chemical. Digging frozen ground, using pneumatic tools, machines or explosives is described in detail. Clay and sandy loam with particles 0.005-0.25 mm. in diam. require special attention; capillary rise in such soils may reach 4 m., and there is a loss in bearing capacity when moisture content exceeds 50 percent. Freezing of these finestructured soils results in damage to pipelines from adfreezing and frost heaving. Special instructions are given for welding of pipes at temperatures below 0° C.; between -10° and 20° C. welding must be done under heated cover with slow heating and cooling of the pipe ends. Below  $-20^{\circ}$  C. welding is prohibitory. Copy seen: DLC.

45902. KARPPINEN, EERO OLAVI. Ecological and transect survey studies on Finnish Camisiids; Acar., Oribatei. Helsinki, 1955. 80 p. 29 illus, 14 tables. (Suomalainen eläin- ja kasvitieteellinen seura Vanamo. Eläintieteellisiä julkaisu-ja, v. 17, no. 2) 57 refs. Summary in Finnish.

Study of this family of oribatid mites from soil samples collected in Finnish Lapland in the course of the third transect survey of the forests. Distribution of the species in Finland is described and their occurrence in the soil of various forests and peatland vegetation types is outlined. Role of microfauna in development of soil is stressed, in particular that of oribatids in forest and peat lands. Successive chapters and data tables deal with sampling technique; material; distribution and habitats of the species: generally and in Finland, its biological provinces, forests, and peatlands; influence of environmental factors upon species and populations: the ground vegetation, temperature and moisture changes, ecological valence of the species, and abundance.

A study based on pollen analysis and plant composition of the peat bogs from material collected in 1938-39 between 66°30' N. and about 68°20' N. The lower part of the peat bogs indicates a considerably warmer climate, with trees reaching to Novyy Port (their present limit is south, at Salekhard). The flora was boreal, and instead of peat mounds, flat muddy areas predominated. The cooling which followed in the post-glacial epoch caused a retreat of forests to the present line, about 120 km. south, and the appearance of permafrost. Permafrost of relatively recent origin with remnants of now more southerly trees is found in the Novyy Port area. A fall of 4° C. is estimated for the period under review. Copy seen: DLC.

General geological structures are described for five cliff sections of the Moncha tundra region. The region lacks uniformly differentiated intrusions, large assemblages of rich ores were not found. This tundra is considered of dispersed magmatic type with pyroxenitic veins (2–3 m. thick). The veins contain copper, nickel, sulfides (pyrrhotite, pyrite, chalcopyrite, pentlandite, etc.), also zinc, magnetite and other minerals. Capacities of nickel and copper are estimated in thousands of tons.

Förhandlingar, 1952. bd. 74, häfte 4, no. 471, p. 455-74, diagr., 2 text maps.) 8 refs. Text in German. Summary in English. Title tr: The geology of the surroundings of Tuoddarjaure on the southern edge of the Sjangeli window.

In a section of the Kebnekaise region of northern Sweden, near 68° N. tectonic features in the southern part of the Sjangeli gap in the Caledonides differ from those in nearby Sweden and in Norway, where the gap is known as the Rombek window. Unmetamorphosed eo-Cambrian conglomerate and sandstone underlie a shattered shale over which it is presumed the great Seve nappe was thrust. Along the border mountains from the region of Laisvall to the region of Kvikkjokk there are conglomerates and other presumably eo-Cambrian rocks resting on the Archean peneplane. Volcanics play some part in the geology of the area and there has been some mineralization. The views of various investigators of the region are discussed. Copy seen: DGS.

In northern Norway, on the south side of the glacier Almajalosjägna, Sulitjelma, is a small moraine which was built by the glacier and later furrowed by readvancing ice. As the glacier retreated a second time, the boulders which produced the furrows were left lying in place on its surface. It is believed that the boulders were frozen solidly into the ice and transported across the surface of the moraine without any rotary motion. This observation has significance in demonstrating the formation of glacial grooves. Copy seen: DGS.

KELSALL, JOHN P., see also Banfield, A. W. F., and others. An aerial survey technique . . . big game. 1955. No. 43858.

45937. KEMMERIKH, A. Pripoliârnyi Ural. (Vokrug sveta, Aug. 1956, no. 8, p. 16, illus., col. plate.) Text in Russian. Title tr.: Sub-polar Ural.

Notes the wild beauty of the Northern Ural and its natural resources, basis for the coming industrialization of the area. Illus. include col. photo. of Mt. Narodnaya (1,894 m.).

Copy seen: DLC.

45938. KEMMERIKH, A. O. Zamerzanie rek. (Priroda, Oct. 1956. god 45, no. 10, p. 127–28, illus.) Text in Russian. *Title tr.:* The freeze-up of rivers.

Observations on river freezing in the Soviet Union are summarized with discussion of the ice movements ("ledokhod") and the final freeze ("ledostav"). The whole process in the U.S.S.R. (including Siberia) takes about three-and-a-half months: October-January. The first rivers to be ice-bound in the European section are those in the Polar Ural and Pay-Khoy region. In Siberia the freezing begins in far northeast on the Kolyma, Anabar, Indigirka, Yana, sometimes at the end of September, and spreads to the south. As a rule, small rivers freeze later than large ones flowing in the same direction. Copy seen: DLC.

45939. KEMP, HAROLD STUART MILLER, 1892– . Northern trader. New York, Bouregy & Curl, 1956. 253 p.

Popular account of the author's life, with his family, in the Lac La Ronge country of northern Saskatchewan: where he was trader primarily for Revillon Frères, 1911–1927; duties at the post throughout the year, habits of the Cree

Indians of the region, fur-trapping methods and trips, etc.

Copy seen: DLC.

45940. KEMP, J. D., and R. M. BAL-LANTYNE. Field evaluation of Canadian Arctic Five-Man Individual Ration Pack, RPX1F, Toronto, 1956. 34 p. illus., tables. (Canada. Defence Research Medical Laboratories. DRML report no. 173–16.) 2 refs.

Report of trials conducted at Fort Churchill with 40 members of the Arctic Instructors course. The design of the pack was found suitable for feeding troops under arctic conditions, but serviceability of individual cartons needs improvement. The quantity of food was adequate; its acceptibility was also evaluated.

45941. KENDREW, WILFRID GEORGE, and D. P. KERR. The climate of British Columbia and the Yukon Territory. Ottawa, Queen's Printer, 1955. x, 222 p. 8 illus., text maps, graphs, 101 tables. Reviewed by Svenn Orvig in Arctic, 1956, v. 9, no. 4, p. 265.

One of a series of reports on Canadian climate (that on the Canadian Arctic Archipelago is listed as No. 25333; Central Canada, No. 45942; that on northern Quebec-Labrador is in preparation).

Climate of northern B. C.-Yukon (north of 55° N.) is dealt with in pt. 2 (p. 147-222). Physical geography and climatic divisions are described briefly, with full treatment of pressure systems, winds, air masses, frontal zones, temperature and humidity, clouds and sunshine, precipitation, visibility. Tabular data are presented from four stations in northern B. C.; ten in the Yukon: Aishihik, Carcross, Dawson City, Elsa, Frances Lake, Mayo Landing, Snag, Teslin, Watson Lake, Whitehorse; also Aklavik in Mackenzie District.

Ottawa, Queen's Printer, 1955. ix, 194 p. illus., text maps, graphs, 212 tables. Reviewed by F. K. Hare in Arctic, 1956. v. 9, no. 3, p. 208.

Based on records from 63 stations, 22 in northern Manitoba, Mackenzie and

Keewatin. Account is given of general climatic features of the region as a whole, accompanied by maps, with emphasis on physical controls determining important elements. Then follow more detailed descriptions of the climate of six regional subdivisions, including the Mackenzie Basin (as region 1) and the Barren Grounds (2-3). For each, the available climatic data are tabulated for winds, temperature, humidity, cloud, sunshine, precipitation, visibility. Climatological tables with monthly values for all climatic elements are given for Fort Good Hope, Fort Resolution, Fort Simpson and Fort Smith in region 1 (p. 92-95) and for Aklavik, Lake, Baker Chesterfield. Churchill, and Coppermine in regions 2-3 (p. 115-119). Copy seen: DLC.

45943. KENNEDY, CLARENCE HAMILTON, 1879— . Professor James Stewart Hine. (Entomological news, June 1931, v. 42, no. 6, p. 177–80.)

Obituary note on this entomologist and explorer, noting his work as entomologist and ornithologist on the first and second Expedition of the National Geographic Society to the Katmai volcanic region of Alaska in 1917 and 1919. Bibliographical notes.

**45944. KENNEDY, WILL.** Breaking the snow barrier. (Field & stream, Jan. 1956. v. 60, no. 9, p. 27–29, 60, illus.)

Describes the Snow Bird, an aerosled or snowmobile for cross-country travel in Canada. Built by the Grover Brothers of Duluth, Minn., the vehicle averages more than 30 m. p. h. with a 65-hp. airplane engine with pusher propeller. Three spring-mounted metal skis with stainless steel runners are attached, one on each side of the vehicle toward the rear and one under the middle of the cabin at the front. The front ski is activated by an auto-steering column. The cabin accommodates six. An account is given of its first trip.

Contains abstract of paper presented before the German Meteorological Society on Oct. 2, 1953 in Berlin. The longest most regular meteorological observations in Finland are available from Helsinki since 1828 and from Oulu (65°00′ N. 25°30′ E.) since 1846. A noticeable improvement in climate occurred during the warmest five-year period, 1934–1938, due to temperature increase, resulting in a climatic shift of the entire country by 400–500 km. to the southwest. Since 1940 a certain regression of temperature has begun.

A brief description is given of a map of magnetic declination showing the mean variation of the compass needle at the beginning of 1950 and the known regions of magnetic disturbance. The map is the result of joint undertaking by the four Scandinavian countries, Rolf Kjaer of Norway chairman; and it was printed in the summer of 1952 by the Hydrographic Office of Norway. It was based on data from 11,254 observation stations in Norway, Sweden, Finland, and Denmark. Several features of the isogonic lines are mentioned. Copy seen: DLC.

45949. KERKUT, G. A., and B. J. R. TAYLOR. Effect of temperature on the spontaneous activity from the isolated ganglia of the slug, cockroach and crayfish. (Nature, Aug. 1956. v. 178, no. 4530, p. 426, illus.) 3 refs.

Account of investigation on isolated pedal ganglia of the slug, thoracic and abdominal ganglia of the cockroach and the crayfish. In all three decreasing temperature was observed to produce a transient increase in activity, whilst an increase in temperature is followed by a temporary decrease of activity. This anomalous behavior is most pronounced in the slug.

and Samoyeds in the village of Lovozero.

Report based on author's investigations in April 1926 at Lovozero on the Kola Peninsula. The population comprised 184 Lapps, 412 Zyryans and 69 Samoyeds, and these groups held, respectively: 1,371, 3,864 and 416 reindeer. living conditions, cleanliness, lighting of the dwellings, food, birth and death rates, use of alcohol and tobacco, and also education are described. The best conditions were found among the Zyryans, with their roomy, well built, clean houses; their abundant food included meat, fish, bread, vegetables and milk; and they had a high rate of school attendance; 46 out of the 65 children at the local school were Zyryans.

45955. KHARITONOV, LUKA NIKI-FOROVICH. O vlifanii russkogo fazyka na fakutskii fazyk. (In: Akademifa nauk SSSR. Ākutskii filial. Institut fazyka, literatury i istorii. Vedushehafa rol' russkogo naroda . . ., 1955. p. 216–30.) 9 refs. Text in Russian. Title tr.: The influence of Russian upon the Yakut

Describes lexical influence of Russian on the Yakut language, giving examples of changes in phonetics and connotation. The chief categories of subject matter, and main words within these categories, adopted during tsarist times are enumerated; some examples of new terminology acquired under Soviet rule are given. A total of about 3000 Russian words were adopted up to the Revolution; the rate of integrating new words has increased rapidly since then, especially in political, scientific and technical fields. According to some preliminary evaluation, words of Russian origin constitute up to 40 percent of the total number of words used in newspaper articles on foreign affairs, 30 percent in editorials, 14 percent in literary prose, and six percent in poetry. 45958. KHEÏSIN, E. M., and T. K. KUZNETSOVA. Kholodostoľkosť fâits, lichinok i vzroslykh klesheheľ *Ixodes ricinus* L. i *Ixodes persulcatus* P. Sch. (Akademifâ nauk SSSR. Karelo-Finskif filial, Trudy, 1956. vyp. 4, ser. parazitologicheskafâ, p. 116–30, illus. tables.) 25 refs. Text in Russian. *Title tr.*: Cold resistence of eggs, larvae and adult of tieks *Ixodes ricinus* L. and *Ixodes persulcatus* P. Sch.

Account of experiments with temperatures as low as  $-20^{\circ}$  C. and exposures lasting up to four weeks. Cold resistence was low in all three stages. This is explained by the fact that these species live in a relatively warm environment, in the litter, under the snow. Exposure to cold increased the cold resistence of the three developmental stages.

45959. KHIBINSKIE APATITY; itogi nauchno-issledovateľ skikh i poiskovykh rabot, 1933. Leningrad, Goskhimte-khizdat, 1933. t. 6: 283 p. illus., maps, tables, diagrs. Text in Russian. Title tr.: Khibiny apatites; summary of scientific investigations and prospecting work in 1933. Vol. 2–5, 7 are described as No. 8593.

Contains 64 papers, introductory and summary statements, reviewing scientific and technological research work on apatite-nepheline and related mineral deposits in the Khibiny tundras during 1931–33. The papers were presented at a conference of scientific research groups and scientific organizations of Khibinogorsk (Kirovsk), Kola Peninsula,

on the subjects of metals, minerals and rare earth deposits, methods of search, prospecting and mining. Preliminary matter comprises a preface by A. E. Fersman; an appeal by Fersman (as chairman) for conference support in further research and in mining of valuable deposits; and a review of the conference program (70 organizations participating) by A. M. Oranzhireeva, who abstracts the main subjects of discussion. introductory speech is given by V. I. Kondriko, "Conditions and problems of research work" in relation to mining activities generally in Kola Peninsula. A second introductory speech was delivered by A. E. Fersman on the past 13 years' research work and major objectives in further development of Khibiny The following 64 papers (titles deposits. translated) are abstracted in this volume of Arctic Bibliography under their authors' Finally (p. 278-80) V. I. Kondrikov summarized the work of this conference.

Kondrikov, V. I. Summary of the work of the Conference and future problems. p. 278-80. *Copy seen:* DGS.

45960. KHMEL'NITSKAIA, A. Neotoslannoe pis'mo. (Sovetskaia zhenshchina, Dec. 1956, no. 12, p. 11–13, illus.) Text in Russian. *Title tr.:* An unsent letter.

Describes life of women workers at the Irkutsk hydro-electric station on the Angara River. Recounts an old Angara legend. Photos by L. Danilov.

Copy seen: DLC.

45961. KHODAK, Ū. A. O flivorite iz nizhnekembrišskikh porod Aldanskogo rajona Ākutskof ASSR. (Akademira nauk SSSR. Doklady, Jan. 21, 1956. v. 106, no. 3, p. 533–36, plate.) 7 refs. Text in Russian. *Title tr.:* On fluorite from lower Cambrian rocks of the Aldan region of the Yakut A. S. S. R.

Results of the study of calcium fluorite (CaF<sub>2</sub>) found in small crystals included in dolomite rocks. Crystallographic characteristics of fluorite are noted and its genesis discussed.

Copy seen: DLC.

45962. KHOLOSTOV, V. G. Kaban v Arkhangel'sko'i oblasti. (Moskovskoe obshchestvo ispytatelel prirody. Bûlleten', Otd. biol. July-Aug. 1956. nov. ser. t. 61, no. 4, p. 82.) Text in Russian. Title tr.: Wild boar in the Arkhangel'sk region.

Contains a record of this animal (a male, two and one-half years old) killed on Jan. 21, 1953, near the village of Odino. This is about 700 km. northeast of the previously known limit of its distribution.

Copy seen: DLC,

45963. KHOMENTOVSKIĬ, A. S. Priznaki verkhne-paleozoIskogo oledenenifa v fizhnof chasti Sibirskof platformy. (Moskovskoe obshchestvo ispytatelel prirody. Bfilleten', 1948. god 119. Otdel geologicheskiĭ, t. 23, no. 4, p. 81–86, text map.) 12 refs. Text in Russian. *Title tr.*: Evidences of Upper Paleozoie glaciation in the southern part of the Siberian platform.

Describes investigations of the character of quartz pebbles and boulders, quartzites and other metamorphic rocks and their distribution on the Siberian platform. The pebble-boulder deposits were locally formed, lower coal-bearing layers of the Permian epoch in the Tunguska basin. The study of pebble distribution indicates that they were carried from the nearest mountains by Upper Paleozoic glaciers and the pebbles themselves represent remnants of Upper Paleozoic moraines.

\*\*Copy seen: DLC.\*\*

45964. KHOMENTOVSKIĬ, A. S. Struktura i tektonika ûgo-zapadnol chasti Sibirskol platformy. (Moskovskoe obshchestvo ispytatelel prirody. Bûlleten', 1945. god 116. Otdel geologicheskil, t. 20, no. 5–6, p. 115–29, text map.) 25 refs. Text in Russian. Summary in English. Title tr.: Structure and tectonics of the southwestern part of the Siberian platform.

Contains structural analysis of the southwestern Siberian platform in the region of the Yenisey - Angara basins. Area of discussion is divided into five parts, which include the Proterozoic massif of the Yenisey ridge and Archeozoic or lower Proterozoic Chadobets massif. The structural similarity of the southern part of the Yenisey ridge and northern foothills of eastern Sayan makes it possible to outline a new aurific region in the eastern Sayan. Copy seen: DLC.

45965. KHOMICHEVSKAĀ, L. S. O ponātii "defatel'nyī slo!" v oblasti rasprostraneniā mnogoletnemerzlykh gornykh porod. (Akademiā nauk SSSR. Institut merzlotovedeniā. Materialy k osnovam ucheniā o merzlykh zonakh zemnoī kory, 1955. vyp. 2, p. 45–51, diagrs.) 9 refs. Text in Russian. Title tr.: The concept of "active layer" in permanently frozen rock areas.

"Ambiguities in the use of the term "active layer" are noted. The use of the terms seasonal freezing and thawing is suggested. The active layer applies to the ground layer affected by winter freezing or summer thawing and also to those layers subject to annual variations in temperature. The term is sometimes applied to all strata located above the permafrost layer. Separate terms are recommended for all these processes and conditions."—SIPRE.

Copy seen: DLC.

45966. KHOREV, B. S., and V. S. VARLAMOV. V srednem Priangar'e. (Geografia v shkole, Nov.—Dec. 1956. god 19, no. 6, p. 6–18, illus., map.) Text in Russian. *Title tr.:* In the middle Angara River Basin.

Reviews construction of several hydroelectric plants planned on the Angara River, with an aggregate capacity of 10 million kw. and an annual production ca. 70 billion kwh. The largest plant, of 3.2 million kw. capacity, is to be built at the Padun Rapids near Bratsk. These installations together with the new Tayshet - Bratsk - Ust'-Kut branch line connecting the Trans-Siberian railroad with Lena Basin, will aid development of the rich natural resources of the area. Map shows location of mineral (coal ,iron ore, salt) resources, roads, and construction projected for the 6th five-year plan. Copy seen: DLC.

KHOROSHIKH, P. P., see Lisitsyna, N. K. Arkheologicheskie issledovanifa . . . 1953 g. 1956. No. 46390.

45967. KHOROSHUK, V. V. Opyt mekhanizovannol uborki snega na Chelfabinskom uzle. (Zheleznodorozhnyl transport, Sept. 1956. god 38, no. 9, p. 69–72, illus.) Text in Russian. *Title tr.*: Mechanized snow removal at the Chelyabinsk railroad terminal.

"The procedure and equipment used for several years are described, and equipment performance is discussed. clearing and deepening of tracksides before snowfall proved effective in drift control and favored better meltwater run-off and low moisture in the roadbed. Compressed air was used for switch Best results were obtained cleaning. with the Balashenko earth mover, the lateral scrapers of which were used for cleaning and deepening the tracksides, and the middle blade for snow removal. The machine could work with snow of any density in contrast to standard railroad snowplows. Its operating speed (3-6 km./hr.) was more suitable for terminal conditions than the 15-18 km./hr. required for standard snowplows."-SIPRE. Copy seen: DLC.

45968. KHOZAINOVA, É. E. Foneticheskafa sistema komi fazyka. (In: Akademifa pedagogicheskikh nauk RSFSR, Moskva. Institut nafsional'nykh shkol. Rodnof i russkif fazyki..., 1956. p. 118-45, tables.) 5 refs. Text in Russian. Title tr.: The phonetic system of the Komi language.

Gives a phonetic analysis of the Komi (Zyryan) language including its southern and northern dialects. Endemic and borrowed phonemes, sound combinations, syllables, accentuation, rules of vowel

gradation, interchange and assimilation of consonants, etc., are discussed.

45969. KHRAPAL', A. A. Gazogenerator na Severe. Moskva, Izd-vo Glavsev-morputi, 1943. 83 p. illus., tables, diagrs., 3 maps, 4 refs. Text in Russian. *Title tr.:* The gas generator in the North.

Contains a general review of the use of solid fuels (brown coal and wood) in truck, tractor and automobile engines and in small electric power stations in the arctic regions. The review was sponsored by the Arctic Scientific Research Institute and a practical introduction contributed by the Main Administration of the Northern Sea Route. Costs of shipping, distribution and use of various fuels are analyzed with statistical data for various northern localities. Wood-gas, generated from local log-chunks, was found to be from three to seven times cheaper than gasoline or naphtha. Construction and operation of gas generators with wood and brown coal are described in detail with consideration of specific cold conditions. Modification of conventional engines for gas fuel is outlined particularly in respect to separate suction and discharge of gases, higher ignition voltage, enlarged radiator capacity and fuel-supply lines. Starting and servicing of the engine are covered in the appendix. Copy seen: DLC.

45970. KHROMOV, SERGEĬ PETROVICH, 1904– . Kolebaniâ klimata i sovremennoe poteplenie. (Priroda, Jan. 1956. no. 1, p. 24–34, 2 sketch maps, 2 diagrs.) Text in Russian. *Title tr.:* Climatic fluctuations and the present warm trend.

A general discussion of climatic cycles and trends. Data on climatic amelioration of the Arctic (Barents Sea basin, Novaya Zemlya, Greenland, Arctic Basin) are presented (p. 28-30); changes in mean annual temperatures are noted.

\*Copy seen: DLC.\*

45971. KHROMOV, SERGEĬ PETRO-VICH, 1904– , *Editor*. Sinopticheskie protŝessy Dal'nego Vostoka. Moskva, Gidrometeorologicheskoe izd-vo, 1940. Photostat in 158 l. of original in 306 p., tables, charts, diagr., graphs (Moskva Tsentral'nyl institut pogody). Text in Russian. *Title tr.*: Synoptic situations

in the Far East.

Contains nine papers prepared by six authors and edited by S. P. Khromov on synoptic situations and movements of arctic air masses in the Far East. Data recorded during the period 1932–36 are analyzed with respect to the direction of movement of cyclones and anticyclones. The studies were made to develop a method for weather forecasting on the basis of identified factors. Each paper (except Sinnitin's and Matinak's) is analyzed in this Bibliography under the author's name, viz:

SUBBOTIN, I. Problems of winter synoptic situations in northeastern Asia.

p. 5-63.

REKSTYN', V. Calendar and characteristics of air masses during winter

above Vladivostok, p. 64-103.

SHTABOVA, A. I. Synoptic characteristic in February-April on the line between Aleksandrovsk and Petropavlovsk, p. 283–304. *Copy seen:* DLC.

45972. KHVATAĬ-MUKHA, KLAVDIĀ FILIPPOVNA. Mestno-tvoritel'nyī padezh s obstoßtel'stvennym znacheniem v ßzyke severnykh khanty; sredneobskiī, kazymskiī dialekty. (In: Akademiā pedagogicheskikh nauk, Moskva. Institut nasional'nykh shkol. Rodnoī i russkiī ſāzyki..., 1956. p. 197–207.) 7 refs. Text in Russian. Title tr.: The locative-

instrumental case with adverbial meaning in the language of the northern Khanty; the central Ob' and Kazym dialects.

Describes the three cases of the northern Khanty (Ostyak) noun: nominative, dative-directional, and locative-instrumental. The last, formed with the suffix -n, -ny, -na, has an adverbial meaning of place, time and mode of action.

Copy seen: DLC.

45973. KHVOSTIKOV, I. A. Zemlíà i solntŝe. (Znanie—sila, Sept. 1956, no. 9, p. 8–12, illus.) Text in Russian. *Title tr.:* The earth and the sun.

Popular sketch of the influence of solar radiation upon atmospheric phenomena; auroras are discussed (p. 11).

Copy seen: DLC.

**45974. KIDD, D. J.** Medical aspects of maritime arctic operations. (Canadian services medical journal, Oct. 1956. v. 12, no. 9, p. 751–57.)

Account of experience gained during cruises of the ice-breaker Labrador in 1954 and 1955. Extra strain encountered by boat and crew and the peculiar climatic conditions are indicated. Protective clothing, diet, quarters, morale are discussed, as well as the problems of diving, flying fatigue (the vessel carried three helicopters). Health of the ship's company is reviewed and future needs in research noted. Copy seen: DNLM.

45975. KIEFT, CORNELIS. Geology and petrology of the Tärna region, southern Swedish Lapland. Academisch Proefschrift, Universiteit van Amsterdam. Assen, Van Gorcum & Comp. N. V., 1952. 98 p. 28 illus. 2 maps, table. (Amsterdam. Universiteit. Geologisch Instituut, Mededeling no. 198.) 24 refs. Summary in Dutch.

The Tärna region, approx. 65°45′ N. 15° E. has several inhabited localities, as well as a road that connects norther castern Sweden and the North Atlantic coast of Norway; much of the region is below treeline. Each of the geologic units in this section of the Swedish Caledonides is described by the writer in turn and petrographically analyzed. The geologic circumstances seem to differ from those in localities recently investigated by Aleva, and Mulder, q. q. v., a short distance to the north. Copy seen: DGS.

45976. KIESLINGER, ALOIS, 1900 - . Karsterscheinungen im hohen Norden. (In: H. Küpper, and others. Skizzen zum Antlitz der Erde, 1953. p. 371-75, 2 illus., diagr., map.) 9 refs. Text in German. *Title tr.:* Karst occurrence in

the high North.

In colder latitudes weathering is generally confined to physical and mechanical forces. Here chemical effects are cited from Spitsbergen, the Lofotens, and from north Norway, where at 67°42′ N., near Sildhopfjell, a tunnel has been developed in coarse-grained marble. Minor karst basins are found nearby. They are believed to be of post-glacial development, probably of the later warm period, and are of smaller dimensions than those described by Gunnar Horn, q. v.

45977. KILBURN, L. C. Geology of the MacBride Lake area, Granville Lake mining division, Manitoba. Winnipeg, Queen's Printer, 1956. 24 p. fold. map. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 55–2.) 3 refs.

Map (scale 2 in.: 1 mi.) covers the area 56°45′-57° N., 99°45′-100° W., between the settlements of Lynn Lake and South Indian Lake. Drainage is southward into the Churchill River system. region is blanketed with glacial drift, primarily sandy and clayey silt. Precambrian bedrock consists of metamorphosed sediments and volcanic and intrusive rocks. Regional structural trend is eastward: no evidence of faulting was found. A basis for chronology is suggested. No known ore bodies occur, but zones for future prospecting are noted. Copy seen: DGS.

45978. KIL'DÍŪSHEVSKIĬ, I. D. K flore mkhov pripolîarnogo Urala. (Akademiîa nauk SSSR. Botanicheskiĭ institut. Trudy, ser. 2, Sporovye rasteniîa, 1956. vyp. 11, p. 313–32, text map.) 6 refs. Text in Russian. *Title tr.*: A contribution to the moss flora of sub-Polar Urals.

Contains an annotated, systematic list of 181 species of mosses collected by the author during his trips in 1948-51, mostly on the banks of various rivers in the Northern Urals: the Kozhim, Khulga, Kempazh, etc. Copy seen: DA.

45979. KIL'DÎÜSHEVSKIÎ, I. D. Podsnezhnoe razvitie nekotorykh vidov flory Malogo ÎAmala. (Botanicheskiî zhurnal, Nov. 1956. t. 41, no. 11, p. 1641–46, 4 tables.) 18 refs. Text in Russian. Title tr.: Under-snow development of some species of the Malyy Yamal flora.

The life of (reindeer) fodder plants under snow cover, was studied during the winter of 1941, at the agricultural station Khus-Yaga on the Nyda River in Yamal Peninsula. Percentage green parts in relation to the whole mass/gm. dry weight, length of the green parts, and ground temperature conditions are tabulated. Plants still partly green when the snow comes may be divided into four groups: some with the green almost gone; others with ca. 5-8 percent, 25 percent, or with all their green parts intact. The ratio between living and dead parts fluctuates all the time. Growth begins in green parts in spring under the snow, where the temperature is much higher than outside. Under-snow development of plants is an established fact but the process is not yet clear.

KIMBALL, D. S., see Bless, R. C., and others. East-west motions . . . aurora. 1955. No. 44053.

45981. KIMBALL, HERBERT HAR-VEY, 1862— . The unusual atmospheric haziness during the latter part of 1912. (Washington Academy of Sciences. Journal, May 19, 1913. v. 3, no. 10, p. 269-73.)

Haziness almost uninterrupted for over two months, as noted at various observatories in the United States, is attributed to (1) meteorological conditions: two anti-cyclonic areas crossed the region in June 1912; (2) smoke from forest fires in Yukon Territory and British Columbia; (3) smoke or dust from Katmai Volcano, Alaska, during eruption. 45983. KINCAID, TREVOR. The Psychodidae of the Pacific Coast. (Entomological news, Feb. 1899. v. 10, no. 2, p. 30-37, 13 illus.)

Contains a key to the genera and descriptions of 12 species, of which 10 are new. Pericoma sitchana n. sp. from Sitka, Alaska, and Psychoda pacifica, occurring in Sitka, Unalaska and Pribilof Islands, are included.

Copy seen: DA.

45984. KINDBERG, NILS CONRAD, d. 1910. Genera of European and North American Bryineae (mosses), synoptically disposed. (Göteborgs k. vetenskapsoch vitterhets-samhälle. Handlingar, 1897. Ny tidsföljd, häfte 32, p. 1–40.)

An introduction to a synoptic moss flora of Europe and North America. Systematic descriptions are given of 169 genera (11 new) in 38 families (seven new). *Copy seen:* DLC.

45985. KING, JAMES R., and D. S. FARNER. Bioenergetic basis of light-induced fat deposition in the white-crowned sparrow. (Society for Experimental Biology and Medicine. Proceedings, Nov. 1956. v. 93, no. 2, p. 354–59, illus.) 29 refs.

Premigratory fat deposition was observed in these birds both under natural conditions and in captivity. This is accompanied by increased food intake (hyperphagia) released by increase in

light. A similar condition was produced experimentally by subjecting the birds in midwinter to 20 hrs. of light per day. *Copy seen:* DNLM.

45986. KINOSITA, SEHTI. Breakdown of snow by impact, I. (Teionkagaku, Low temperature science, Sapporo, 1955, ser. A, no. 14, p. 95-111, illus., tables, graphs, diagrs.) 10 refs. Text in Japanese. Summary in English

Text in Japanese. Summary in English. "The method of measurement is described, and the results of experiments on several types of snow are discussed. A solid lead cylinder (5 kg.) was fitted into a hollow iron cylinder with a steel spring at the bottom along which high resistance wires were stretched. cylinder was dropped into snow from a height of 0-6 cm. and the changes in the resistance of the wires with the contraction and expansion of the spring were recorded with an electro-magnetic oscillograph, thus recording the resistive force of the snow. A large resistive force, lasting about 0.01 sec., was observed when the cylinder touched compact snow, after which it became constant. In wet, granular snow, the oscillogram showed large amplitude fluctuations. For soft snow the resistive force increased gradual-The energy absorbed by compact snow increased with the mass of snow compressed. The ratio between the mass of snow compressed and energy absorbed was 0.5:1.5. The rate of compression of granular snow decreased gradually with the increase of energy absorbed."-SIPRE. Account of experiments which suggest that tolerance to cold is significantly greater at rest than during moderate exercise; this was not appreciably changed by short-term cortisone or corticotropin administration or by adrenal suppression. However, long-term cortisone administration definitely increased tolerance to cold both at rest and during moderate exercise. **Copy seen:** DNLM.

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. Test pits and core boring with rotary-drilling equipment, commonly-used methods for subsurface exploration, have disadvantages when applied to frozen ground. Drive sampling procedures with various equipment were used at the Permafrost Research Area of the U. S. Corps of Engineers near Fairbanks. Equipment used is noted. Further experimentation is needed.

First four of six articles which discuss the outstanding climatological features and month-to-month evolution of the prevailing tracks of cyclones and anticyclones in the Northern Hemisphere. The months July through Feb. are considered; last two articles to follow in 1957. Includes discussion of arctic and subarctic regions. Copy seen: DN-HO.

46000. KLEINERMAN, JEROME. Effects of changes in arterial pCO<sub>2</sub> on cerebral blood flow and metabolism during hypothermia. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia... symposium, Oct. 1955, pub. 1956. p. 251–52, illus.) 2 refs.

Report of investigation on dogs aimed to clarify whether low metabolism during hypothermia contributes to hypoxia of brain tissue. Cerebral flow was found to increase with increasing ApCO<sub>2</sub> values, and animals with the highest ApCO<sub>2</sub> had the lowest cerebral O<sub>2</sub>-consumption.

Copy seen: DLC.

46001. KLEIVAN, HELGE. Labrador i støpeskjeen; trekk av et kulturskifte. (Polarboken, 1956, p. 65-98, illus., text map.) Text in Norwegian. *Title tr.:* Labrador in the casting ladle; features of a cultural change.

Sketch of early Eskimo and Indian inhabitants of the Labrador Peninsula, and the influences of early white contacts: the Moravian missions from the latter 18th century, traders, European settlers, Eskimo numbers now increase northward in proportion to settlers. In the south there is racial blending and decreased use of native languages, except at the Eskimo community of Rigolet in Hamilton Inlet and the Indian settlement at Davis Inlet. Both English and Eskimo are to be taught in public schools. Analysis is given of present-day influences upon native life and culture, including epidemics, discarding of native tools and equipment, work opportunities at Goose Bay airport, incorporation of Newfoundland and Labrador into Canada, recent discoveries of uranium and copper near Makkovik, and the proposed power development at Grand Falls. Brief account of a hydrobiological expedition to Bering and Okhotsk Seas on the schooners Nerpa and Krylatka in Apr.-Nov. 1955, sent by the Institute of Oceanography and the Pacific Research Institute of Marine Fisheries and Oceanography, chiefly for study of the distribution of cetaceans and plankton. Nerpa made an oceanographic cruise in Bering Sea, covering the whole area west from 170° W. and making hydrobiological stations every 30 miles (cf. text map, p. 33). Considerable fields of plankton (chiefly Calanus cristatus) were found in the central part of the Sea and in Aleutian waters. Many large sperm whales, moving in small groups westward in spring and eastward in fall were observed off the Commander and Aleutian Islands, and various other large whales (fin, sei, grey whales), also lesser finners, killers, dolphins, sea lions, fur seals and other marine fauna were encountered in quantity in the central and southern areas of Bering Sea. The Krylatka carried out a similar study in southern part of Okhotsk Sea and off Kuril Islands.

46015. KNECHT, R. W. Relationships between aurora and sporadic-E echoes at Barrow, Alaska. (Journal of geophysical research, Mar. 1956. v. 61, no. 1, p. 59-69, illus., 4 graphs.) 16 refs.

"During Mar. 1951, a series of visual auroral observations were made simultaneously with ionospheric soundings at Barrow (71°17′ N. 156°30′ W.). Auroras were visible during 82 percent of the 379 observations, made at least every 15 min. during the dark hours of 10 successive clear nights. Three nights are described in detail. Statistical results include (1) a strong tendency for sporadic-E (Es) echoes at frequencies≥ 7 Mc to be recorded when aurora was near

the zenith; (2) a direct relationship between brightness of (inactive) aurora and the top frequency of Es echoes; (3) evidence for the correspondence of (oblique) Es echo ranges with estimated slant ranges of visible auroral forms. The observations lend support to the view that ionization in the immediate vicinity of visible auroral forms gives rise to ionospheric-type reflections at high frequencies."—Author's abstract.

Contains results of a study carried out in the Pechora-Ilych reserve in Arkhangel'sk province, during the last eight years. The elk (Alces alces) was found to be a very fast-growing animal; it attains 160 kg. weight at the end of its sixth month, when growth often stops due to poor nutrition during the winter; if sufficiently fed, it might reach 200 kg. and more by the end of the first year. Growth continues fast during the summer of the second year, and the young elk might weigh 350 kg. at 18 months. intensity of growth in summer time depends greatly on weather conditions: cool and rainy weather is the best. During the third year of life, growth is much less intensive, and it is completed during the fourth year. The mature elk's weight fluctuates sometimes 20 percent, especially during the mating season (males 17 percent, 5 percent The authors recommend dofemales). mestication of the elk, with castration and selection the best means of increasing its live-weight. 46018. KNOWLES, DAVID M. Geology and petrology of the Wabush Lake iron ore formation, Labrador. (Canadian mining journal, June 1956. v. 77, no. 6, p. 165.) Abstract of M. S. thesis, Michigan College of Mining and Technology, 1955.

The deposits at Wabush Lake (53°02′ N. 66°52′ W.) occur in an extensive series of meta-sediments which probably represent the southern and southwestern extension of the Labrador Trough. The iron formation is a slightly banded to massive rock, consisting almost entirely of glassy quartz and specular hematite with minor magnetite. Other minerals are noted, and formation of the iron deposits is described. *Copy seen:* DGS.

46025. KNUTH, EIGIL, Greve, 1903- Danmark Fjord. (Fra Nationalmuseets arbejdsmark 1956, p. 71–78, illus.) Text in Danish. Title tr.: Danmark Fjord.

Contains an account of a visit by the author and one companion to Kap Holback in the interior of Danmark Fjord (81°30′-80°50′ N. 20°-25° W., North Greenland) in 1954 and an expedition to the same place with a different companion in 1955 to investigate Eskimo remains, found in 1907 during the Mylius-Erichsen expedition. These remains, 5-6 m. above sea level, belong to a paleo-Eskimo culture and are about 2,800 years old, about 1,000 years younger than the majority of paleo-Eskimo remains found by the author, 12-20 m. above sea level, in Pearyland (82°55' N. 32° W.) and on Prinsesse Ingeborg Halvø, 150 km. southeast of Pearyland. This latter culture has been named by him the Independence Culture (Independence Fjord, 82°10' N. 28° W.) and he now suggests the name Independence II for the younger culture. In 1955, remains of the older culture were found on the Kap Holbæk site as well. Corresponding finds have been made by Jørgen Meldgaard in arctic Canada.

**46028. KOBY, VICTOR.** SAC-CONAD. (Canadian aviation, Feb. 1956. v. 29, no. 2, p. 36-40, illus.)

Contains a popular account of the operation of the Strategic Air Command (SAC) and the Continental Air Defense (CONAD). The use of the Canadian radar chains and the Royal Canadian Air Force long-range intercepters for defense and that of the more than 1,500 long-range bombers of SAC for retaliation are described.

KÖHLER, HILDING. Beobachtungen über den Ionengehalt und das Potentialgefälle der Luft auf dem Pårtetjåkko vom 1. Juli 1914 bis zum 30. Juni 1916. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 2, Meteorologie und Geophysik, Abt. 1, Lfg. 1, pub. 1923. p. 39-76, illus., diagrs., graph, 2 plates, tables.) Text in German. Title tr: Observations on ion content and potential gradient of the atmosphere on the Pårtetjåkko.

Instruments and methods used for measuring ion content and potential gradient of the atmosphere are described, and precautions taken to protect the devices from rime, snow, and wind damages are discussed. Daily and annual values of periodicity are tabulated and graphed for the period 1914–1916. The effects of relative humidity, temperature, wind direction, and atmospheric pressure variations on the atmospheric electricity elements are discussed on the basis of tabulated data. The influence of fog, stratus clouds, and precipitation on the data observed is analyzed.

Copy seen: CaMAI.

46034. KÖHLER, HILDING. Meteorologische Beobachtungen auf dem Pårtetjåkko während des Beobachtungsjahres 1. Juli 1915 bis 30. Juni 1916. Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907-1939. Bd. 5, Arbeiten des Pårtetjåkko-Observatoriums, unter besonderer Leitung einer K. Kommission, Lfg. 3, pub. 1939. p. 211-319, Text in German. tables.) Title tr.: Meteorological observations on the Pårtetjåkko during the observation year July 1, 1915 to June 30, 1916.

Contains tabulated daily values for each month of atmospheric pressure, temperature, humidity, wind direction and speed, hydrometeors, sunshine duration, cloud types and movement, snow depth and density, and ground temperature. The data recorded at this mountain observatory (67°29′6″ N. 17°37′57″ E., altitude 1834 m.) are in sequence to No. 45403.

46036. KÖHLER, HILDING. Studien über die Nebelfrostablagerungen auf dem Pårtetjåkko. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 2, Meteorologie und Geophysik, Abt. I, Lfg. 1, pub. 1923. p. 1–38, illus., diagrs., tables.) Text in German. Title tr.: Studies on ice deposits from fog on the Pårtetjåkko.

The results of systematic studies in 1915–16, at this Swedish observatory at 1830 m. elevation, on various rime deposits from fog, and meteorological factors influencing them are reported in detail, and the methods of measurement are described. Soft rime consists of featherlike or plate crystals accumulating on the windward side of objects and forms, independent of fog, at temperatures below -9.7° C. down to -25.5° C. by sublimation when the air is saturated with respect to ice. Hard rime occurs in the presence of fog at all temperatures below 0° C. in the form of white cones apically attached to substrate and has a fibrous structure and a granular internal appearance. It is caused by the freezing of supercooled water droplets and sublimation. Rime occurs generally at temperatures from 0° to -12° C., is amorphous, and consists of transparent or grayish, opaque ice. The effects of temperature, humidity, wind direction and speed, elevation, and insolation on the formation of rime deposits are examined individually, and data on the water equivalent of each deposit with varying wind directions and the length of the deposits are tabulated. Copy seen: CaMAI.

46037. KÖHLER, HILDING. Untersuchungen über die Wolkenbildung auf dem Pårtetjäkko im August 1928 nebst einer erweiterten Untersuchung der Tropfengruppen. (In: Hamberg, A. Naturwissenschaftliche Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd, 2 Meteorologie und Geophysik, Lfg. 2, pub. 1930. p. 77–128, illus., diagrs., tables.) 13 refs. Text in German. Title tr.: Investigations of cloud formation on the Pårtetjäkko in August 1928 and an expanded investigation of the droplet groups.

Experimental investigations of water droplet distribution in fog and results obtained are presented. Methods of measurement and installations are described. Droplet radii were calculated and the relationship between water content and droplet size was investigated. Physical problems related to droplet density and the formation of snow crystals are analyzed.

46038. KÖPPEN, WLADIMIR PETER, 1846–1940. Versuch einer Klassifikation der Klimate, vorzugsweise nach ihren Beziehungen zur Pflanzenwelt. (Geographische Zeitschrift, 1900. v. 6, p. 593–611, 657–79, diagrs., tables.) Text in German. Title tr.: Attempt at a classification of climates, preferably according to their relationships to plant life.

Contains climatic classification by divi-

sion of plant life into five groups: A, megatherms (great heat: tropical vegetation); B, xerophiles (plants loving dryness: steppe plants); C, mesotherms (moderate heat: vegetation of sub-tropical regions); D, microtherms (little heat: vegetation of temperate zones); E, hekistotherms (hardly any heat: arctic flora). These five groups are further subdivided into 24. For group E there are four, with the names taken from the fauna, viz., the arctic fox, the penguin, the yak, and the chamois. The 24th, F, has eternal snow and no vegetation. The features of climate peculiar to each class are pointed out as characterized by the quantity and duration of precipitation and the general thermal conditions of the different seasons. 46041. KOJIMA, KENJI. An experimental study on regelation. (Teion-kagaku, Low temperature science, Sapporo, 1954, ser. A., no. 13, p. 29–36, illus., graphs, diagr.) 5 refs. Text in Japanese. Summary in English.

The experiments, made with an ice column 8 cm. in diameter, studied the cutting speeds of loaded wires and cords of different thermal properties (isotropic and anisotropic, good and poor con-Tests at room temperatures (18°-23° C.) showed that regelation is due to pressure melting and heat loss to the outside through the cutting material. Cutting is independent of heat conducted into the ice through the wire. Ten-hour loading of ice with a weighted (with 5 kg.) enameled Cu wire at temperatures slightly below 0° C. produced no cutting action, but when the temperature was raised above 0° C., the wire began to cut through the ice at a rate of 0.6 cm./hr. No plastic deformation was noted."-SIPRE. Copy seen: DLC.

46042. KOJIMA, KENJI. Viscous compression of natural snow layer, I. (Teion-kagaku, Low temperature science, Sapporo, 1955, ser. A, no. 14, p. 77–93, illus., graphs.) 8 refs. Text in Japanese. Summary in English.

"The viscous compression of a snow cover is analyzed mathematically on the basis of data collected in 1954-55 at Sapporo (Japan) on the thickness and density variations of individual snow layers during time intervals of 5-10 days. The viscous compression of the snow cover, as a function of time was determined by calculating the viscous compression of each layer, taking into account the thickness and daily increment in density of the given layer, the pressure exerted on it by the upper layers, and the weight of the layer itself. mean rate of compression of the snow cover was 10 gm./day sq. cm. during the first week, reaching about 104 gm./day sq. cm. after 2 months. The values for individual layers varied from 6.6-18 gm./ day sq. cm. Formulas for calculating each factor involved are presented, and results are graphed."-SIPRE.

46045. KOLESNIKOV, ARKADIĪ GEORGIEVICH, and V. I. BELĀEV. O kristallizatŝii pereokhlazhdennof vody, podverzhennof turbulentnomu peremeshivaniū. (Akademißa nauk SSSR. Doklady, Aug. 21, 1956. god 24, t. 109, no. 6, p. 1129–32, graph.) 6 refs. Text in Russian. Title tr: Crystallization of supercooled water under turbulent mixing.

"The development of crystallization in supercooled water is expressed mathematically on the basis of experimental data. Several hypotheses and simplifications were made to develop a system of differential equations by considering the number of ice crystals as equal to the difference between the rate of crystal

formation and the rate of deposition of new crystals on crystals already formed. Underwater ice observations showed that the crystals retain the form of thin discs so that heat losses for growing crystals in a turbulent flow approximate those of discoidal bodies. Water-temperature variations were considered only for large crystals because new-crystal deposition on preexisting crystals occurs rapidly. The ice crystal contents calculated by the formulas developed were close to the experimental data obtained by V.  $\widehat{\Lambda}$ . Al'tberg in 1939."—SIPRE.

Study of the breeding and spread of this pine moth during 1921–1955 is described, with attention to the stimulating causes and to the density of population. Extensive damage was observed mainly to coniferous forests (fir and cedar) in the Chulym, Ket', Chet', Tom River regions and in western Altay. Low spring water, dry summer and small precipitation (snow and rain) create conditions favorable for breeding. Measured density of worms/sq. m. of area serves as guide to concentration for local extermination.

A study of these plants and animals in the Lena, its tributaries and lakes, based on material collected during the Yakutsk Branch of the Academy of Sciences' ichthyological survey of 1948-51. Qualitative and quantitative aspects, seasonal fluctuations, local variations in composition, etc., were investigated at numerous stations. Appendices contain systematic list of the forms (some 521 in 14 groups) found in the area studied; and their occurrence in the stomachs of fish studied. F. E. Karantonis and others, q. v., reported on the fishes.

46054. KOMARETSKAIA, O. A. loparskogo ėposa. (Murmanskoe obshchestvo kraevedenifa. Doklady i soobshchenia, 1927. vyp. 1, p. 39-43.) Text in Russian. Title tr.: From the Lapp epos.

The writer collected statistical data on the Lapp population of western Lapland, in winter 1926-27, in the area of Lakes Imandra and Notozero and the Girvas, Lota, Tuloma and Kola Rivers. Incidentally, she studied the folklore and collected tales about the seldy, spirits believed to live among the rocks and stones of lakes, who were helpful to the Lapps in their fishery, etc., but when annoyed, e. g. by noise, turned men into stones. Belief in seldy, evidently connected with sorcery and shamanism, was current only among the old people. Some 14 stories about these spirits and their intervention in human affairs as recorded by the author, are attached (p. 40-43).

KOMAROV, A. G. K voprosu ob ostatochnol namagnichennosti gornykh porod v svíazi s ikh vozrastom. (Akademis nauk SSSR. Doklady. Sept. 11, 1956. t. 110, no. 2, p. 260-63, 5 tables.) Text in Russian. Title tr.: A 11 refs. contribution to the problem of residual magnetization of rocks in connection with

their geological age.

Based in part on investigation of rocks of the Polar and sub-Polar Urals. Rocks closely allied by their petrological characteristics are found to have different magnetic properties, but magnetic characteristics of very different rocks of the same geological age are identical. The ratio of residual and inductive magnetization and the absolute magnetization of closely related rocks vary in inverse proportion to their age. The ratio of residual and inductive magnetization of rocks of the same age is identical even in different mountains (Urals and Sayan Mts.). The alkalinity and ferro-magnetic mineral content of the rocks affect their magnetic susceptibility but their ratio of residual and inductive magnetization is determined chiefly by their geological age.

the Khibiny tundras.

Basic radiological investigation of khibinite is systematically reviewed for study of: roles and laws for distribution of radioactive elements in the earth's core; extension of the law of crystallo-chemistry on dispersion of typical elements; precise determination of the radiological characteristics of minerals of the masandriterinkolite and lovehorrite group in connection with their mining and re-processing to rare earths. Radiometric determination of such elements as thorium, uranium, radium is described in detail and their content in 25 Khibiny minerals is tabulated (p. 137-138). Discussion is added of the paper, also of No. 43493. Copy seen: DGS.

Lapps' marks.

Summary of author's paper delivered to the Society Dec. 5, 1926, based on his studies and collection of over 3,000 Lapps' marks. The marks indicate the owner's first name, father's name, family name and village, and they pass from father to children with some ramifications or simplifications of design. They were used till the end of the 19th century in lieu of signature and for branding utensils and implements, but not reindeer. The evolution of marks and their legal and economic significance are discussed; 350 examples, all from the second half of the 19th century, are illustrated; and the evolution demonstrated on plate 12. The literature on Lapps' marks (2 items) and other, smaller, collections are mentioned, and the need of further investigation is stressed.

Describes (with cross-section, deck plan, etc.) motor-ship specially reinforced for arctic service. It is 139.4 m. in length with seven watertight bulkheads, 17.6 m. wide and 7.85 m. draft with full load. Powered by seven-cylinder MAN diesel engine, it develops 6390 hp. at 115 rpm for speed 17.39 knots. The British Lloyd classification is given as the ice class 1. A (for navigation among ice). Other arrangements, machinery equipments and crew accommodation, etc., are specified. Copy seen: DLC.

46061. KONDORSKIĬ, E. I., and others. K teorii spontannol namagnichennosti ferromagnitnykh poluprovodnikov v oblasti nizkikh temperatur. (Akademiâ nauk SSSR. Doklady, Aug. 11, 1956. t. 109, no. 5, p. 931–34.) 10 refs. Text in Russian. Other authors: A. S. Pakhomov and T. Shiklosh. Title tr.: Theory of the spontaneous magnetization of ferromagnetic semi-conductors in the region

of low temperatures.

Quasi-classical theories on the diffraction of neutrons in ferrites and their alloys are discussed. Authors' formula for the relation between spontaneous magnetization and low temperature differed from those of N. Kaplan and S. V. Vonsovskil at their low temperatures. In analysis of this discrepancy, the method used in the theory of ferromagnetism of metals and alloys is applied with consideration of the quantum theory. A set of integral equations is presented for general formulation of magnetization in the zone of low excitation conditions of the energy spectrum system. A new relationship between spontaneous magnetization of ferrite and temperature can be more precisely formulated by statistical-thermodynamic computation and use of low values of wave number (k), corresponding to low temperatures. 46063. KONDRAT'EV, V. I. Geofizicheskie metody razvedki medno-nikkelevykh rud rafona Moncha-tundry. (In: Khibinskie apatity, 1933. t. 6, p: 175–76.) Text in Russian. Title tr.: Methods of geophysical prospecting for copper-nickel ores in the Moncha Tundra region.

Two electrical prospecting methods used are described; anomalies indicated were verified. Geologically all anomalies of this region are of three types: those related to distribution of ultra-basic rocks, anomalies related to contact of basic rocks with gneisses, and those in the region of gneiss distribution. Cause of the anomaly is not always indicated by surface mining; wells drilled to 50 m. depth are more reliable.

English translation by E. R. Hope pub. by Canadian Defence Research Board, Ottawa, June 1957 in its T247R: Geomagnetic effects of oceanic and monsoon path electric circulations, four papers by V. V. Shulelkin and L. A. Korneva,

p. 12-15. Copy at CaMAI.

An attempt is made to represent and explain the large anomalous geomagnetic field of the earth. A vector chart of the current-equivalent of the anomalous field in the Arctic is given. An analysis of this chart indicates that there is no new closed region in the Arctic with maximal values of the east component, and no marked concentrations of current density are evident.

Recounts the work over many years of Soviet scientists and prospectors aiming to discover diamantiferous rocks in the plateau of northwestern Yakutia. Theoretical considerations based on similarity of its geological structure to that of Southern Rhodesia are indicated, also the searches by parties of the local Amakinskafa Expedition, the Central Expedition (TSentral'nafa ékspeditsifa), and those of the All-Union Geological Institute and the Scientific Research Institute of Geology of the Arctic (Nauchno-issledovatel'skil institut geologii Arktiki, NIIGA). In exploration of the Markha River basin (left tributary of the Vilyuy) garnets were found, which proved to be pyropes, similar to those in Southern Rhodesia. Exploration in the upper reaches of the Markha by L. A. Popugaeva in 1954 resulted in

discovery of the first diamond-bearing funnel or pipe (trubka) of kimberlite blue ground. In a systematic multiparty search in 1955, several patches of kimberlite were discovered near and above the Arctic Circle, at Udachnaya, Osennyaya, Mirnyy, etc. Camps are set up for open-pit mining, and various methods of extraction are used, with a rich yield of diamonds. Difficulties are encountered in supplying the camps due to lack of roads and adverse climate. The importance of the find to Soviet industry is noted.

English. *Title tr.:* Geology and petrography of the Keret' district of northern Karelia.

Basic structures of the Keret' district (66°17' N. 33°34' E.) are described with consideration of the sequence of magmatic intrusions and analysis of their move-General geological review (p. 66-75) concerns an ancient mass of various paragneisses with biotite, amphibolegarnet and cyanite gneisses and metabarites (cf. map illus, p. 67, et seq.). The tectonics are analyzed (p. 75-80) with respect to the observed axes and angularities of folds. The petrographic discussion (p. 80-96) includes the supracrust metamorphic formations, also intrusive rocks (granite, migmatite, gabbroanorthosite, porphyrite and others).

h

O

Production processes of variously shaped peat (spherical, cylindrical, prismatic, oval, etc.) were studied with a view to increasing output. The output is affected mainly by length of the drying period and convenience in turning the pieces over to dry. Small cylindrical pieces, automatically made during excavation, were found to be the most efficient in shape and they dried uniformly in a comparatively short period. Nozzles for production of peat cylinders and a machine for rolling them over for drying are outlined with illus.

Untersuchungen HANNES, 1895- . über die Beziehungen zwischen der Pflazendecke der Moore und der Beschaffenheit, besonders der Reaktion des Torfbodens; eine pflanzen-ökologische Studie mit Rücksicht auf die praktische Bewertung der Ergebnisse. 1927. 219 p. 15 tables. (Finska mosskul-Vetenskapliga skrifter, turföreningen. 80 refs. Text in German. no. 7.) Title tr.: Investigation of the connection between the plant cover of bogs and their character, especially the reaction of peat soils; an ecological study with summary of the practical value of the results.

Use of vegetation as indicators of nutrient values of bog soil can be made by thorough evaluation of their associations. Plant cover, soil acidity, peat composition, and elimatic, edaphic, biotic, and areal factors are investigated. The problem involved is the management required to turn a natural peat soil into a medium for producing culture plants. Bogs studied include some in northern Finland.

Tiedonannot (Archivum) 1955, pub. 1956. v. 10, no. 2, p. 153-60, 2 tables.) 19 refs. Text in German. Title tr.: Preliminary report on the water chemistry of the Stratiotes lakes in Kittilä, Finnish Lapland.

Water chemistry has been little investigated in the flora problem of these lakes. In 1955-56, water samples were taken from Jeesiöjärvi and Sotkajärvi. Chemical analyses are tabulated and compared with analyses from Vesijärvi in southern Finland and Pajala in arctic Although pH in the north Sweden. Finnish Stratiotes lakes is high, the electrolytic factor is believed most important in the growth of hydrophytic flora. The study was undertaken to ascertain the influencing factors of the growth of Stratiotes aloides and other eutrophic plants (listed p. 153) which are found in 14 of these so-called Stratiotes lakes. A related study is reported by J. Salonen, Copy seen: DLC. q. v.

Doklady, Mar. 1, 1956. t. 107, no. 1, p. 135–38, text map.) 10 refs. Text in Russian. Title tr.: A scheme of the geologic-structural subdivision of the Okhotsk Sea and of the bordering folded structures.

Fourteen types of geological structure are distinguished in the Okhotsk Sea, its islands, Kamchatka, and adjacent coastal areas to the upper reaches of the Kolyma River. Distribution of these types is shown (map) and each characterized in turn with statement of its occurrence. The main structural features are (1) Paleozoic, in a narrow strip parallel with the northwest coast from the Shantar Islands to Penzhinskaya Bay; (2) Jurassic and Lower Cretaceous, extending along both sides of the first zone and covering the northwest coast to the upper Kolyma; Tertiary folded belts, over the southern, southeast and northeast areas including nearly all Kamchatka; with (4) an embedded zone of Upper Paleozoic folded belt from Kamchatka to Sakhalin Island. (5) The central part of Okhotsk Sea between the second and third zones is Archean in structure, (6) The sea bottom depression northwest of the Kuril Islands is a Quaternary active zone. These features are related to other structural types of the region, and to bottom elevations and depressions on the basis of recent explorations. Copy seen: DLC. SI

46116. KRASOVSKIĬ, V. I. Izluchenie neba i polârnykh siâniI; iz programmy Mezhdunarodnogo geofizieheskogo goda. (Akademiâ nauk SSSR. Vestnik, May 1956. v. 26, no. 5, p. 29-31.) Text in Russian. Translated into English by E. R. Hope as: Study of sky and aurora (4p.). Ottawa, Aug. 1956. Canadian Defence Research Board. Directorate of Scientific Information Service, T224R. (Copy at CaMAI). Title tr.: Radiation of sky and of auroras; from the program of the International Geophysical Year.

Discusses studies to be headed in the U. S. S. R. by A. I. Lebedinskii, professor at the University of Moscow; the specially equipped observation stations include those at Murmansk and Tiksi. Planned research comprises synoptic reporting of auroras, regular electrophotometry and spectrography of sky luminescence and the aurora. Synoptic maps will be plotted for the auroras during 15 min. intervals for correlation with solar activities and other phenomena in upper atmosphere such as variations in earth magnetic field and air currents, conditions in ionosphere, etc. Causes for these variations will be analyzed. Automatic photographs will be taken at 5 min. intervals for photometric analysis, and the 180-degree wide-angle cameras will be

supplemented by visual observations. The major problems of the spectrographic research will be related to detection of hydrogen emission and Doppler's displacements, important for estimation of velocity of the solar corpuscular stream, causing the auroras. A north-south chain of stations will reveal latitudinal regularities in the aurora spectra. Continuous electro-photometric and spectrographic recording of polar phenomena and zodiacal light will be carried out. The aurora also will be studied by set of radar installations around Murmansk and in Tiksi Bay. Copy seen: DLC.

I.

A comparative evaluation of the number of microbes (and their biomass) at various depths (to 900 m.) of the Arctic Basin (two "North Pole" stations), North Pacific Ocean, and the southern Okhotsk, Black, and Caspian Seas. The paucity of microbial population of the Arctic Ocean is evident as well as their numerical decline below the 50 m. depth (except in the Black Sea). The causes of these conditions and the qualitative distribution of bacteria are discussed.

Copy seen: DLC.

46129. KRISS, ANATOLIĬ EVSEE-VICH, 1908- . Mikroorganizmy tundrovykh i polârno-pustynnykh poehv Arktiki. (Mikrobiologiâ, Sept.-Oct. 1947. t. 16, vyp. 5, p. 437-48, tables.) 15 refs. Text in Russian. *Title tr.*: The microorganisms of tundra and polardesert soils of the Arctic.

A study of soils, plant roots, red snow and permafrost of Vrangel Island, Chukotsk Peninsula, Kolyuchin Island and some other spots on route of an expedition of the Academy of Sciences in 1938. Quantitatively, up to 1.5 million bacteria per gm. of dry soil were found, with a tenfold decrease at 30 cm. depth and a fortyfold reduction at the permafrost level. Qualitatively the microflora contained bacteria, cocci, mycobacteria, yeasts, actinomycetes, fungi, etc.

Copy seen: DLC.

46130. KRISS, ANATOLIĬ EVSEE-VICH, 1908–. O mikroorganizmakh v vechnoï merzlote. (Mikrobiologiâ, 1940. t. 9, vyp. 9–10, p. 879–87, tables, diagrs.) 18 refs. Text in Russian. Summary in English. *Title tr.:* Microorganisms of the permafrost.

Account of investigation of the permafrost and active layers on Kolyuchin and Vrangel Islands. Quantitative determinations between the topsoil and the permanently frozen layer showed a great range of variation, the frozen zone being much poorer or devoid of microorganisms. The microflora consisted of spore-bearing and non-bearing forms, actinomycetes, nitrifying and denitrifying bacteria; aerobic cellulose bacteria and azotobacter. The problem of anabiosis under these conditions is discussed.

46132. KRIŤSKIŤ, S. N., and M. F. MENKEL'. Zadachi gidrologii v svíazi s gidrotekhnicheskim stroitel'stvom v shestoľ píatiletke. (Meteorologiía i gidrologiía, Dec. 1956, no. 12, p. 9–17.) Text in Russian. *Title tr.*: Hydrological problems in connection with hydraulic construction in the sixth five-year plan.

Hydrological problems are analyzed from the viewpoint of operation, design, etc., of hydraulic installations. Expansion of installations on Siberian rivers (Angara, Irtysh, Yenisey Ob', etc.) requires forecast of the hydrological phenomena for control of river flow of which little is known especially in the permafrost region. Systematic study of seasonal, annual and maximum discharge and run-off is required. A system of widely dispersed stations with modern hydrometric equipment is suggested for regular observations of basic data.

46138. KRÜGLER, FRITZ. Maritimmeteorologische Kleinstudien am Eisrand in der Dänemarkstrasse. (Seewart, Apr. 1953. Bd. 14, Heft 2, p. 3-9, illus., diagrs., map.) Text in German. *Titte* tr.: Small maritime-meteorological studies at the ice limit in the Denmark Strait.

Contains results of observations and studies made by the author aboard the fishing vessel Meerkatze during 1952 in the Gammelloch region. Anomalies of the surface water temperature in the mixing zone were ascertained (variations of 5° C. within two hrs.). Series measurements of the temperature at intervals of several minutes are required to draw conclusions concerning the distance of the ship from the edge of the drift and pack ice. Radar equipment aboard the ship was effective only at a distance of one nautical mile from the ice despite a calm sea. misleading nature of narrow drift-ice formations near the actual ice limit is discussed. The presence of low and high fog-formations due to different temperature stratification, and peculiar optical phenomena causing differences in visibility over the warmer and colder water (icewater) are indicated.

46140. KRUSENSTJERNA, EDVARD von, 1908— . Mossflora och mossvegetation vid Harsprånget och i Syd-Muddus i Lule Lappmark. Stockholm, Almqvist & Wiksell, 1954. 37 p. illus., maps (Svenska vetenskapsakademien. Avhandlingar i naturskyddsärenden, nr. 10) 34 refs. Text in Swedish. Summary in English. Title tr.: Moss flora and moss vegetation at Harsprånget and South Muddus in Lule Lappmark.

Account of field study made in midsummer 1947 with description of the areas and their geology. The flora of Harsprånget, site of a great hydroelectric power plant was thus studied before the upstream water level was raised (1952). Its moss vegetation is reported here, with data on associations and habitats; corresponding information is given about the southern part of Muddus National Park. Mosses and liverworts from both areas are listed; plant geographical considerations are discussed and comparison made with other (Sarek, Kuusamo) areas. Muddus has more varying habitats (14 types) than Harsprånget (7) owing to its greater size, deep canyons, etc. These two regions have fewer moss species than Sarek or Kuusamo, yet about 60 of them are not known from Sarek, and 9 not in Kuusamo.

46142. KRYPTON, CONSTANTINE, pseud. The Northern Sea Route and the economy of the Soviet North. New York, Frederick A. Praeger, 1956. ix. 219 p. text map, tables. (Research program on the U. S. S. R. Studies, no. 14. Praeger publications in Russian history and world communism, no. 42) 384 refs.

A continuation (1917–1954) of the writer's earlier work (*Arctic Bibliography* No. 30246); based on unpublished and published sources mainly Soviet.

Introductory review of economic and strategic factors involved in Soviet development of the Route, also problems of sovereignty, is followed by consideration of the shipping lanes (5) especially the Kara Sea run, and the role of Glavsevmorput'. The central chapter 3, extensively documented, deals with the economic potential of areas serviced by the Route: coal, oil and minerals, the fisheries and sea-hunting, lumber, fur trade, agriculture, etc. Factors in their development are considered: power, manpower, such natural conditions as permafrost, and Soviet "management policy which eliminates individual initiative and concentrates power in officials at the apex of the bureaucracy," especially injurious to the extreme North. Concluding chapters survey navigation, vessels, port facilities on the Route, aviation and river transport; cargoes and turnover; Soviet incentives in developing the Route are appraised: economic, scientific, cultural and, as predominant, strategic. Copy seen: DLC.

46143. KRYZHANOVSKIĬ, S. G. Razvitie salaki v vode povyshennom solenosti. (Voprosy ikhtiologii, 1956, vyp. 6, p. 100-104, illus.) Text in Russian. Title tr: Development of the sprat in water of increased salinity.

Account of experiments to rear this species in White Sea water (S=25°/oo) as against its normal environment in the Baltic ( $S=4-5^{\circ}/_{\circ\circ}$ ). Whether the sprats were kept in the high-salinity water from the egg stage or transferred into it after early development in a brackish medium, they failed to reach the larval stage. The experiments were made with the aim of transplanting this commercial fish to the White Sea.

46144. KUCERA, RICHARD E. Snow studies related to trafficability on the Greenland icecap. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954, p. 409-429, illus., graphs.) 8 refs.

"The results of transportation capability studies made at 38 test locations along the route from Thule Ramp to Mile 320 are reported; the methods of investigation are described; and the differences between the marginal zone and the dry snow zone are analyzed with respect to temperature, density, and hardness. The initial density of naturally compacted snow varied from 0.25 to 0.50 gm./cc., with the higher values in the marginal zone, increasing after compaction by a weasel and sled unit to 0.35-0.60 gm./cc. in the transition zone and 0.38-0.42 gm./cc. in the dry snow zone. The increase in snow density under natural conditions is rapid to a certain point, beyond which it increases at a slower rate. Age hardening after artificial compaction occurs after several hours. Snow with a lower density at low temperatures will sustain heavier load than higher-density snow at temperatures near the f. p. The depth of sled penetration is a function of snow hardness and is more constant in the dry snow zone. Weasel sled runners provide good flotation on varying snow surfaces, but specific design features reduce the overall efficiency. Tractor sled runners exerting a pressure of more than 0.88 p. s. i. are suitable on ice but very inefficient in dry snow. Data are graphed on variations in hardness, density, and penetration of snow, the relation between density and max. depth of compaction, that between initial snow hardness and sled penetration, the change of density in relation to number of weasel and sled passes, and age hardening."-SIPRE. 46148. KUDRÍAVÍSEV, M. N. Avtomobil'nye dorogi, chast' 2; remont, soderzhanie i proektirovanie. Izd. 2e. ispr. i dop. Moskva, Izd-vo dorozhno-tekhnicheskol lit-ry Gushosdora MVD SSSR, 1950. 235 p. tables, illus, diagr., graphs, 13 refs. Text in Russian. Title tr.: Automobile roads, part 2; repairs, maintenance and planning. 2nd rev. and enl. ed.

Textbook approved by the Labor Division of the State Administration on Highways of Ministry of Internal Affairs, for colleges on roads and mechanics.

Various problems in road construction and maintenance are dealt with, including the winter maintenance of highways (p. 43-60). The effects of snow cover on road trafficability are discussed, and theories on snow movement near the ground and on the formation of snowdrifts with various forms of relief are given. Methods of snowdrift control and machinery for snow removal from roads are The problems of controlling described. road slipperiness and road protection from sandstorms are briefly discussed. Conditions of road surveying and prospecting are presented (p. 105-108), with consideration of permafrost regions. effects of permafrost and associated phenomena on roadbeds are described with emphasis on naleds and the changing permafrost conditions after road construction. Low fills frequently cause a drop of the permafrost table and the accumulation of ground water under the roadbed, a process that leads to frost heaving. Permafrost formation in high fills sometimes causes subgrade creep over the frozen strata. Destruction of forest and vegetation cover during road construction also changes the thermal conditions of the soil and should be considered in locating a road together with the possibility of protecting the permafrost from degradation by using peat interlayers under the roadbed. The planning and laying of the roads through the regions subject to landslide and through marshlands are outlined with illus. (p. 108111)—From SIPRE. Pt. 1 of this work, by the writer and A. Â. Bykov (352 p.) pub. 1949, deals with road construction; it includes a brief account of snow and ice roads, previously listed as No. 30252.

46154. KUKHARENKO, T. A. Guminovye kisloty torfov i osobennosti ikh struktury. (Akademiâ navuk BSSR. Minsk. Instytut torfa. Trudy, 1954. t. 3, p. 120–32, tables, graphs.) 9 refs. Text in Russian. Title tr.: The humic acid of peat and specific features of its structure.

Formation of peat, as the youngest stage of coal and graphite, is studied on the basis of the chemical nature of humic Three groups of the acid are considered: soluble in water, in alcohol, and nonsoluble (humus). The composition and properties of the last group vary with different stages of coal formation. The composition is correlated with the origin and stage of peat formation. Genetic classification of humic acid is tabulated, as are the characteristics of hydro-carbons in the hydrogenization of humic acids for different stages, and the solubility of product of their decomposition. Humic acid from different solid fuels can be investigated also by X-rays and their interferential maximums on the difractional picture vary from younger to older origin. Copy seen: DLC.

46155. KUKLIN, A. Prokhodka shakhtennykh stvolov sposobom zamorazhivania. (Master ugla, June 1956. t. 5, no. 6, p. 9-11, illus, graph.) Text in Russian. *Title tr:* Drilling mine shafts with the freezing method.

Drilling through water-bearing layers is described from work at the Dorogo-buzhskiy coal deposit. The section of the shaft where seepage occurred was bored at slightly larger diameter (15 percent) to accommodate a freezer column, connected with a refrigerating unit. The column remained in the shaft until drilling was completed; 25 shafts, with a total length of 2375 m.,

were completed in 34 days, by the turbodrill with the freezing method.

46160. KULLING, OSKAR, 1898—. Berggrunden söder om Torneträsk. On the Caledonides to the south of Torneträsk in the mountains of northern Swedish Lapland. (Geologiska föreningen, Stockholm. Förhandlingar, 1950. bd. 72, häfte 4, no. 463, p. 454-71.) 9 illus. Text in Swedish. Summary in English.

On the basis of remapping in 1950, the rocks and tectonics of a section of the mountains of northwestern Sweden are described. The area concerned extends from Torneträsk southward to Rautasjaure-Allesjokk-Appörjaure-Sjangeli, westward to the Norwegian border, and to the eastern margin of the mountains at Luopakte. Above the Archean beds and the lower Cambrian sedimentary, the socalled Hyolithus series (believed to be in situ) overthrusts of the Caledonides are found to include Archean as well as younger formations. The so-called Seveköli nappe complex is subdivided. Summary is added (p. 489-92) of the oral discussion following the lecture.

The effects of depth and density of snow cover on soil temperature 'are discussed, and depth-density data for the protection of wintering crops are graphed. Compacting of snow is considered as a protective measure against loss of snow from drifting, and lowering of soil temperature in upper ground layers. Various methods of snow compacting with horse- and tractor-driven arrangements are described. Optimum temperature for wintering crops ranges from  $-5^{\circ}$ to -15° C. In deep snow, increase of snow density protects the upper ground strata from thawing; a density of 0.20 is sufficient to protect against drifting over large areas of the U.S.S.R. In areas with winds of 14 m./sec. and more, the snow should be compacted to a density of 0.25-0.30.-From SIPRE.

KUPREVICH, VASILIĬ FEOFILOVICH, 1897-, see Savich, V. P., and others. O...antibiotike iz lishaĭnikov... 1956. No. 47808.

46168. KURBATOVA-BELIKOVA, N. M. Itogi izucheniâ mikrobiologicheskol deâtel'nosti v estestvennykh torfânykh zalezhakh. (Akademiâ navuk BSSR, Minsk. Instytut torfa. Trudy, 1954. t. 3, p. 133–45, tables, graphs.) 19 refs. Text in Russian. Title tr.: Results of the study of microbiological activity in natural peat beds.

Microbiological investigation of the decomposing vegetation in different swamps and marshlands is described. The activity of bacteria, molds and actinomycetes, covering the vegetative remains was studied in situ and in laboratory samples. Active microorganisms are usually concentrated in the upper layer of the peat mass. Intensity of the decomposition processes depends mainly on the type of peat formation. Concentration and distribution of molds, aerobic and anaerobic bacteria at various depths of the swamps are presented in tables and diagrams. Formation of peat is considered a short-time process which is basically completed during a few vegetational periods.

Copy seen: DLC.

46169. KURBATOVA-BELIKOVA, N. M., and T. A. SHINKAREVA. Izmenenie mikroflory frezernogo torfa v svíazi s ego samorazogrevaniem. (Akademiſa navuk BSSR, Minsk. Instytut torfa. Trudy, 1953. t. 2, p. 40-58, tables, graphs.) 10 refs. Text in Russian. Title tr.: Change in the microflora of milled peat in connection with its self-heating.

Results of microbiological investigations are correlated with the authors' data on generation of heat in peat-crumbs in storage with the rapid growth of microorganisms. Quantitive and qualitative variation in composition of the microflora does not indicate clearly the tendency to self-heating. Presence of mold and actinomycetes, however, precedes the development of coccus, bacillus, thermophyllites and bacteria. Moisture, nitrogen and phosphorus are active stimulants for self-heating. With moisture at 30-40 percent, the microflora consists of molds and actinomycetes; from 40 to 60 percent there is disappearance of the mold and intensive growth of bacteria with rise of temperature especially in the upper layers of the peat. Measures to prevent self-heating of peat-crumbs at present are mainly limited to ventilation of the local mass with rising temperature.

46170. KURBATOVA-BELIKOVA, N. M., and T. A. SHINKAREVA. Mikrobiologicheskii metod opredelenia sklonnosti torfov k samorazogrevaniū. (Akademiā navuk BSSR, Minsk. Instytut torfa. Trudy, 1953. t. 2, p. 33-39, table.) Text in Russian. Title tr.: A microbiological method for determining the tendency of peat to self-heating.

Reports study of thermal effects of certain microorganisms in peat masses and of conditions favorable to self-ignition. Growth of molds, mold fungi (actinomycetes), bacteria and microorganisms on the organic residue of peat were studied under laboratory conditions, and the results are tabulated with data of thermal effects. The presence of moisture, nitrogen and phosphorous accelerates the self-heating, this tendency in peat may be indicated by both microbiological and chemical analyses. Copy seen: DLC.

46171. KURCHATOV, G. N., and G. I. GRANIN. Lenskomu parokhodstvu 100 let. (Rechnof transport, Aug. 1956. god 15, no. 8, p. 1–3.) Text in Russian. *Title tr.:* A hundred years of Lena River steamboat navigation.

Contains an historical review of river navigation from its initiation by Cossacks in 1619 with small boats. The first steamer, Pervenets, was built in 1855, and in 1917 the river fleet was enlarged to 32 steamers and 107 barges of 21,000-ton displacement. Further expansion came with gold-mining developments along the Lena and Aldan. By 1955 three different river navigation organizations were in operation with many steamers, tugs, tankers, and numerous barges for cargo transportation. Navigation time from the port of Osetrovo (Ust'-Kut) to Yakutsk and Tiksi was reduced from 2-3 weeks to 4-6 days; Lena River shipping goes clear to the sea, and on to the Khatanga, Anabar, Yana, Indigirka and the Kolyma, as well as to the ports of

f

5

f

Tiksi and Pevek. The Lena is now becoming an important waterway for transporting coal, oil, lumber, and mining construction materials. During the next 10-15 years, cargo will probably double or triple in volume. A major problem for the future therefore is to close the existing gap between fleet capacity and port facilities for loading, storage, repairs, and wintering bases.

46172. KURDÍŪMOV, S. V. Kompleksnafa mekhanizatsifa neélektrifitsirovannykh torfopredprifatif srednef i malof moshchnosti. (Akademifa navuk BSSR, Minsk. Instytut torfa. Trudy, 1955. t. 4, p. 78–90, illus., diagrs.) 2 refs. Text in Russian. Title tr.: Expanded mechanization of non-electrified peat enterprises of medium and small output.

Rapid expansion of the peat industry is discussed on the basis of a broad mechanization of the intermediate production. In the limited preparation of the bog for excavating, the following machines are used: large and small excavators (shovels), bulldozers, cultivators (harrows), graders and rollers. For excavation, drying and collecting of peat mosses, excavators of various types are used, also spreaders, machines for turning or rolling over the turfs, for collecting and loading them in piles and cars. Large chain-type excavators are used for the trench and for reloading piles into transportation equipment. machines and their operation are described with illus. Copy seen: DLC.

Study of the strength and other characteristics of special concrete mixtures with additives, to harden below freezing temperature is described in detail. Two

types of specimens were used in tests: (1) experimental blocks prepared with different compositions and under various practical conditions; and (2) blocks or pieces cut from actual construction under various winter conditions in different regions. Strength and frost resistance of concretes of various composition are analyzed. Additive concentration varied with atmospheric temperature, and the concentration of 18 percent CaCl<sub>2</sub> + 4.5 percent NaCl was found to be the most frost resistant for a range of temperatures between -8° and -26° C.

(Zoologicheskiľ zhurnal, Aug. 1956. t. 35, no. 8, p. 1118–30, 4 illus., 6 tables.) 10 refs. Text in Russian. Title tr.: Some regularities of intra-specific morphological and biological variability of marine invertebrates.

Contains results of an ecological study of Littorina saxatilis, L. obtusata, L. littorea and Mytilus edulis, carried out on the littoral zone of the eastern Murman coast and the White Sea. The most important findings are summarized as follows: (1) The variability of external morphological and biological characteristics of individuals of various populations (group variability) also of individuals of the same population (individual variability) are determined by the influence of environmental factors. (2) The degree of individual variability is determined not only by the strength and duration of the environmental conditions but also by the life cycle of animals. (3) Fluctuation of variability is attributed to the peculiarities of the life cycle, especially the methods of reproduction (oviparous and viviparous). (4) Differences among the individuals of various populations increase with age. Individual differences within a population decrease with age, and this leads to stabilization of the population's characteristics. Tabular data are offered on the variability of some biological characteristics of Barents and White Seas invertebrates; also on changes of the growth rate and longevity of some molluses of Barents Sea.

46188. KUZNEZTSOV, V. V. Rost pribrezhnykh morskikh makrofitov i potreblenie imi pitateľ nykh veshchestv v Barentsovom i Belom moríakh. (Botanicheskií zhurnal, Apr. 1956. t. 41, no. 4, p. 510–21, illus.) 22 refs. Text in Russian. Title tr.: Growth of littoral marine macrophytes and their consumption of nutrients in the Barents and White Seas.

Growth characteristics of Fucus vesiculosus, F. inflatus, F. serratus and Ascophyllum nodosum are discussed and tabulated. Estimate of their biomass, growth rate of 12 species (table 2-3) and their consumption of nitrogen are given. The role of macrophytes as source of food for many fish species is stressed.

46202. LACHENBRUCH, ARTHUR H. Effect of the ocean on permafrost temperatures. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1714.)

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31-Nov. 2, 1956. Temperature difference between land surface and ocean bottom, thermal properties and moisture content of sediments, also past changes of climate and shore lines determine ground temperatures near ocean edge. Theoretically, permafrost more than 100 ft. beneath ocean bottom is not to be expected generally more than a mile offshore. Geothermal effects of water bodies may explain anomalously large outward earthheat flow at Resolute Bay, Cornwallis Island. Copy seen: DGS.

46203. LACHENBRUCH, ARTHUR H. Method of estimating the thermal influence of heated buildings on permafrost. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1808.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. "A formal solution has been obtained for the problem of heat conduction in a homogeneous semi-infinite medium in

which the temperature of the surface varies sinusoidally with time and the mean temperature and amplitude of the variation are different within and outside an arbitrarily shaped region of the surface." Results can be applied to study of ground temperatures disturbed by bodies of water or heated buildings.

V., 1952. 95 p., 33 illus., 2 maps, 5 tables. (Amsterdam. Universiteit, Geologisch Instituut. Mededeling no. 188.) 29 refs. Summary in Dutch

The region investigated (approx. 66°05' N. 15° E.) with the Norwegian frontier to the north, can be reached by the motor road from Tärna, in the upper Ume basin in Sweden, to Mo i Rana in Norway. Most of the area is above the tree line, has thin soil, poor vegetation, and bedrock well exposed. Below the tree line, outcrops are confined largely to stream banks. Unintegrated stream flow, resulting from recent glacial activity, is the common drainage feature in this area which is on the Baltic-Atlantic divide. It is climaxed by a lake with an eastern outlet ultimately connecting with the Atlantic and a western outlet to Baltic drainage. In the northeastern section, where limestone is found, there is karst topography, with sinkheles and blind valleys, and a stream that runs underground for several hundred meters. This report is essentially on the bedrock geology: the several units are described, petrography and petrology of the rocks is presented, with a brief

46222. LAMBE, THOMAS WILLIAM, 1920 Modification of frost-heaving of soils with additives. (National Research Council. Highway Research Board. Bulletin, 1956. no. 135, p. 1–23, illus., graphs, 10 tables.) 13 refs.

Describes three years' experimentation by the writer and personnel of the Arctic Construction and Frost Effects Laboratory, U. S. Army. Fifteen soils were tested and about 40 additives; the latter may be grouped according to their action in soil as: void pluggers and cements, aggregants, dispersants, and "water-proofers." A number of these, especially dispersants and polyvalent cation salts, merit further laboratory evaluation. A small-scale field test showed a laboratoryproved dispersant to be effective under field conditions, including two freezing cycles. Four freeze-thaw cycles on four soils tested in the laboratory also had no adverse effects. Copy seen: DGS.

46223. LAMBERT, A. F. The international boundary. (Canadian surveyor, Dec. 1955. v. 12, no. 10, p. 676-91,

illus., maps.) 14 refs.

A brief history is presented of the development of boundary delimitations between the U. S. and Canada, and between Canada and Alaska. The present boundaries represent the results of various treaties, negotiations, and arbitrations during the period 1783–1925. The

Alaskan boundary extending 674 mi. from Mt. St. Elias along the 141st meridian to the Arctic Coast is probably the longest straight-line international boundary in the world.

Contains information on temperature and thermoregulation; main physiological aspects of hypothermia; principal advances in animal and human experimental hypothermia; hypothermia and O<sub>2</sub>-consumption; medical application.

Copy seen: DNLM.

46227. LAMPERT, H. Balneologische Aufgaben in Island. (Polarforschung,

May 1956. Jahrg. 24, Heft 1-2, p. 295-97.) Text in German. *Title tr:* Balneologi-

cal tasks in Iceland.

Account based on two trips by invitation of the Iceland Government, with the aim to ascertain the possible utilization of the hot springs for medical purposes for both local and foreign patients. Hundreds of steam, water and mud wells were examined and their therapeutic value is indicated. Hveragerdi in the south, some 60 km. from Reykjavik, is described and proposed as an ideal place for developing a modern spa.

46228. LAMPHERE, EDWIN M. Operation of experimental septic tank units under subarctic conditions. (*In:* Alaskan Science Conference . . . 1952. Proceedings, *pub.* 1954, p. 68–71.)

Results of experiments with four experimental septic tank units at College, Alaska, in 1950 are presented. Three of the units consisted of septic tanks with tile disposal fields, and the fourth of a septic tank and sand filter. Provision was made for heating both the tanks and the fields. Results of the operation of these units showed that the cost of midwinter starting is too high for the average Observations on the sand house owner. filter indicated that some freezing occurred near the most exposed side. The importance of an undisturbed snow cover over the filter effluent trench is indicated. Tank efficiency is considered satisfactory. Copy seen: DGS.

46229. LANDAUER, J. K., and F. ROYSE. Energy of snow compaction and its relation to trafficability. Wilmette, Ill., Oct. 1956. 11 p. illus., diagrs., tables. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Research paper 14.) 6 refs.

Penetrometer tests were performed on natural snow near Houghton, Mich., on Jan. 9 and Mar. 7, 1956. Work per unit area was found to be independent of the penetrometer area and appeared to be greater at low and high velocities than at intermediate rates. The power used to compact snow is much less than that used by over-snow vehicles which leaves unanswered the question of the observed high energy losses. *Copy seen:* CaMAI.

46230. LANDAUER, J. K., and H. H. PLUMB. Measurements on anisotropy of thermal conductivity of ice. Wilmette,

Ill., Apr. 1956. 4 p. diagrs., tables. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Research paper 16.) 5 refs.

"A comparison technique is used to measure the anisotropy in the thermal conductivity of ice. Samples of laboratory grown monocrystals, glacial monocrystals, and polycrystalline commercial ice were studied. No effects due to the grain boundaries are observed. experiments indicate that the conductivity in the direction of the c-axis may be about 5 percent greater than normal to it. The probable error in the results is about 2 percent. Analysis of the data leads to the conclusion that, if a difference in conductivity exists, it is less than 8 percent. More accurate experimentation is necessary to specify the anisotropy with greater precision."-Authors' ab-Copy seen: CaMAI.

46231. LANDERGREN, STURE. Om apatitjärnmalmernas bildningsbetingelser. (Geologiska föreningen, Stockholm. Förhandlingar, 1949. bd. 71, häfte 2, no. 457, p. 293–302.) 12 refs. Text in Swedish. Title tr.: On the conditions of development of apatite iron ores.

In contrast to view (expressed by B. Asklund, q. v.) that iron ores such as those found at Kiruna originate from certain magmas, Dr. Landergren holds that the iron enrichment results from both endogenic and exogenic processes in the orogenic cycle of the upper lithosphere. He cites supporting geochemical evidence, takes exception to some of Asklund's statements, and suggests further consideration and discussion.

46237. LANEUVILLE, JEAN. Porosity and adsorptivity in iron ores from New Quebec compared with standard ores. Quebec, 1953. 22 p. diagr., 3 graphs, 4 tables. (Quebec, Province. Dept. of Mines. Laboratories Branch. Preliminary report, no. 277.) 10 refs.

Eight samples of limonitic hematite from northern Quebec were compared with a magnetite from Kiruna, northern Sweden, and three limonitic hematites from other parts of North America. Apparatus and procedure are described, and results are discussed. "Generally speaking, porosity in [northern Quebee] ores is greater than in the other ores... Measurements of porosity permitted establishing a comparative scale of ore reductibility. For equal surface area of pores, the ores adsorb carbon dioxide in proportion to their content of uncombined water... Carbon dioxide is selectively adsorbed by iron oxide gels and limonitic substances."

Basic handbook, almost completely rewritten. Deals with past, present and future prospecting, fundamentals of geology, minerals and rocks, mineral deposits and fuels. Canadian geology is outlined by region, nine in the Arctic and sub-Arctic. Instruction facilities in geology, mining and prospecting, including Northwest Territories and Yukon, are given. Equipment and travel in isolated regions, methods of prospecting, geophysical prospecting (in detail), exploring and appraising mineral deposits are described. Specific metals and minerals are noted, placer and small-scale lode mining, mining laws, etc. are dealt with. Selected references (some annotated) follow each chapter. Appended are table of elements and other aids, lists of government agencies, periodicals, etc., methods of tracing float in glacial drift. References to arctic and subarctic areas occur throughout; excellent photographs are included. *Copy seen:* DGS.

46244. LANGLO, KAARE. On the amount of atmospheric ozone and its relation to meteorological conditions. Oslo, Grøndahl & søn, 1952. 48 p. diagrs., maps, tables. (Geofysiske publikasjoner, v. 18, no. 6.)

Ozone measurements, made for varying periods from 1926-1949 at a number of Norwegian stations including Dombås, Oslo, Tromsø, and Arosa, as well as several British stations, are analyzed. A brief description is given of the optical method of total ozone measurement. Annual and latitudinal variations in the mean ozone are discussed. The problems of ozone distribution and irregular variations due to various meteorological phenomena are also discussed. Selected upper-wind data for Ocean Weather Station "M" (66° N. 02° E.) are included to illustrate observed winds in the ozone incline region. A comparison between ozone data and observance of mother-ofpearl clouds in Norway from 1939-1949 indicates that these clouds are observed on days with lower than normal ozone values. Copy seen: DWB.

46250. LANTIS, MARGARET, 1906—. Social anthropological research in Alaska: opportunities and obstacles. (*In*: Alas-

kan Science Conference . . . 1952. Proceedings, pub. 1954. p. 155-60.)

The scope of social anthropology is defined. Its study in Alaska is retarded by lag in the development there of sociology and psychology. Social science studies made recently (mostly by economists) or underway are listed. Alaskan concept of the term "native" is another obstacle to sound development of social anthropology. Confusion is noted regarding place of Eskimos and Indians, but the new Alaskan culture is indigenous, not a transplant, author stresses: the various ethnic elements present contribute to it. Some examples of research problems in social anthropology are presented with comments. Copy seen: DGS.

46254. LARSEN, HELGE EYVIN, 1905—. Æresformand i Det grønlandske selskab. (Grønland, Mar. 1956, nr. 3, p. 120, port.) Text in Danish. *Title tr.:* Honorary President of Det grønlandske selskab (The Greenland Association).

Tribute to Ejnar Mikkelsen, President of Det grønlandske selskab 1935–1956 and elected Honorary President on his retirement this year *Copy seen:* DLC.

46255, LARSEN, L. Grønlandshvalen og dens skaebne. (Grønland 1953, hefte 7, p. 265-70, illus.) Text in Danish. *Title tr.:* The Greenland whale and its fate.

Contains general historical notes on whaling in arctic waters mainly by the Dutch, English and Scandinavians. The first Greenland whale (Balaena mysticetus) caught was by the Dutch at Spitsbergen in 1612. Gradually whaling was extended to the Greenland Sea and west coast of Greenland. Dutch whaling off Spitsbergen and Greenland reached a peak in 1701 when 18,000 persons were employed in the industry and over 200,000 barrels of oil produced. In 1911 the last expedition (a failure) was sent out for Greenland whales, now protected by international law.

46256. LARSEN, L. Hvalfangsten ved Grønland. (Grønland 1953, hefte 11, p. 437-40, illus.) Text in Danish. Title tr.: Whaling off Greenland.

Surveys whaling (baleen whales) since

its start in 1925 by the Royal Greenland Trading Company. The SS. Sonja (gross tonnage 127) was used and from 1951 the Sonja Kaligtok (gross tonnage 250). A few catch data are given: 50 animals the first year decreasing to five in 1939. Operations were suspended during the war; 1946, 61 whales were caught; in the following years: 68, 32, 30 and 46. Fluctuations in the catch are considered to be due to changes in feeding conditions, temperature and to the constant mist some years, rather than to excessive hunting.

Copy seen: DLC.

46257. LARSEN, OLUF. Sommertandlæge i Grønland. (Grønland, Feb. 1956, nr. 2, p. 57-65, illus.) Text in Danish. *Title tr.:* Summer dentist in Greenland.

A Danish dentist recounts his experiences during three summers in Greenland: at Frederikshåb and Sukkertoppen visited in 1953, Angmagssalik (65°36' N. 37°38' W., East Greenland) and Scoresbysund in 1954, and Thule in 1955. Caries is increasing with consumption of imported foodstuffs. Of 125 school children at Frederikshåb, three had healthy teeth. (At the settlement Neria in the Frederikshåb district, on the other hand, only a single child of ten had one cavity.) In Sukkertoppen conditions were worse and writer's work consisted mostly in providing artificial teeth. At Angmagssalik conditions were excellent, especially among adults. The Scoresbysund visit was short. At Thule all the inhabitants were treated, one per household requiring full set of artificial teeth. Dental care is free of charge in Greenland. More dentists are needed, also more preventive care: improvement of diet, propaganda and dental care in the schools.

Trudy, 1953. t. 2, p. 145–57, tables.) Text in Russian. Title tr.: Measures for increasing the yield of hemps on peat soils.

Discusses the growth of two main types of hemp, which require different soils and cultivation. One type is used for its fibrous stems in cords, ropes, textiles, etc. The other is used for seed, also in production of oils for food or paints; and its residue, for building materials, paper and plastics. Deeply rooted hemp absorbs large amounts of moisture and acts therefore as a vigorous drier of the marshland. Better quality of fibers is obtained on peat soils with superphosphates, phosphoro-bacterine and copper-containing fertilizers. Soil for seed-type hemp requires another cultivation: sometimes a field garden is used after harvesting vegetables, extensive cultivation and fertilizing. Copy seen: DLC.

The Quaternary team of the Volch'ya Tundra party of the Academy of Sciences' Kola Expedition in 1932 collected material on the last glaciation in Volch'ya Tundra, north of Moncha Tundra. In the period of maximum glaciation, both tundras were buried under glaciers 1 km. thick, moving from west to east; periods of nunataks and local glaciers followed. Diatomites, sands, gravel and pebbles, occurring in deposits formed in those times, have industrial value. An "island" of permafrost was encountered amidst marshes.

Conditions for formation of deposits in the tuffaceous layer of the Tungusskian strata, Yenisey-Lena platform, are described. These deposits are considered as an accumulation of typical pyroclastic materials, subjected to considerable local transport. The problem of separation of the trap rocks of the intrusion phase is discussed on the basis of the study of the tuffaceous layer in the basins of rivers: Taymyr, Chuna, Nizhnyaya Tunguska, Angara and others; a definite sequence in intrusion is established. Location of any type of trap rock intrusion in a definite zone of the strata indicates its morphological character. The latter defines the petrographic type of the intrusion, distribution of separate mineralogical phases, and degree and direction of their differentiation.

46277. LEBEDEV, D. V. Vvedenie v botanicheskufu literaturu SSSR; posobie dlîa geobotanikov. Moskva-Leningrad, Izd-vo Akad. nauk SSSR, 1956. 382 p. (Akademifa nauk SSSR. Botanicheskil Text in Russian. institut.) Title tr.: Introduction to botanical literature of the U.S.S.R.; a manual for geobotanists.

Basic work with emphasis on phytogeography, covering four principal groups of material: bibliographies; synoptic works and manuals; classical works of Russian botanists; and important monographs and separate papers published in the last 20-25 years. Besides geobotanical and floristic literature, the bibliography includes the important works in such allied sciences as physical geography, geology, geomorphology, climatology, meteorology, soil science, agriculture, forestry, as well as general scientific reference works. Many of the publications listed deal with the Soviet arctic regions; important in this respect are sections on the North of European U. S. S. R. (p. 62-65); Siberia and the Far East (p. 94-105); tundra (p. 124-28); algae (p. 183-87); lichens, (p. 194-96); mosses (p. 197-201); etc.; many scattered references appear in other sections as well. Author index is appended (p. 356-78); foreword (p. 3-6) is signed by the editor, E. M. Lavrenko. Copy seen: DLC.

46278. LEBEDEV, V. G. Rechnol led kak rel'efoobrazu@shchil faktor. sofuznoe geograficheskoe obshchestvo. Izvestifa, Jan.-Feb. 1956. t. 88, no. 1, p. 85-87.) 2 refs. Text in Russian. Title tr.: River ice as relief-forming factor.

In spring 1950 and 1951, the author observed the run-off of winter ice on the Angara River; pressure of the great mass of ice raised alluvial layers and made walls 7-8 m. high along the bank, affecting the relief of the river valley. Observations by S. G. Boch in Northern Ural and by other scientists are considered.

46281. LE BLANC, J. S. Evidence and meaning of acclimatization to cold in (Journal of applied physiology, Nov. 1956. v. 9, no. 3, p. 395-98, illus., table.) 11 refs.

Account of standard cold tests in soldiers exposed for four months to winter conditions at Fort Churchill, Manitoba, and frequently experiencing thermal discomfort. At the end of the winter, heat production caused by the standard cold exposure was smaller than in the fall, which is interpreted as evidence of acclimatization to cold.

Copy seen: DNLM.

46282. LE BLANC, J. S. Impairment of manual dexterity in the cold. (Journal of applied physiology, July 1956. v. 9, no. 1, p. 62-64, illus., tables.) 5 refs.

Account of experiments which support the hypothesis that increased viscosity of synovial fluid is a factor in lowering finger dexterity in the cold. It is, however, not the only factor, since cooling of the arm whilst keeping the hands warm, also reduced finger dexterity.

Copy seen: DNLM.

46283. LE BLANC, J. S. Rearing of lemmings at Fort Churchill, Manitoba. (Journal of mammalogy, Aug. 1956. v. 37, no. 3, p. 447-48, table.)

Contains observations on a lemming colony (Dicrostonyx groenlandicus richardsoni), started in 1950 by Defence Research Northern Laboratories. The average life span was approx. 661 days. The optimal rearing conditions are: air temperature (most important factor) of 35-45° F. in winter, 45-65° in summer; light as prevailing in the vicinity of lemming habitats; for feeding, pellets and vegetables (carrots and cabbage). Diabetes, observed in 1950-52, was eliminated when the rolled oats eaten in large quantities in the winter, were replaced with pellets. Fluctuations in population density are tabulated.

Copy seen: DSI.

46284. LE BLANC, J. S. Study on blood ascorbic acid levels of personnel at Fort Churchill, Manitoba. Fort Churchill, Manitoba, Dec. 1955. 15 p. illustables. Process print. (Canada. Defence Research Northern Laboratory. Report no. 3/55.) 19 refs.

Contains a study of over 330 individuals, which revealed that the winter intake of ascorbic acid should be increased by about 30 mgs. in order to bring the blood levels of the cold season (0.7 mg. %); also, the blood level was found to be higher in females, in younger and in lean persons. A high incidence of scurvy is reported among native infants.

Copy seen: DNLM.

46285. LE BRASSEUR, R. J. Zooplankton distribution in the northeast Pacific Ocean. (Canada. Fisheries Research Board. Pacific Coast Stations. Progress reports, no. 107. Nov. 1956. p. 3-5, illus., map.)

Contains a report on the material collected by Canadian and American agencies during the summer of 1955 (Project Norpae). The zooplankton was found abundant along the Alaskan coasts, but patchy in the open sea. Little difference in vertical distribution was observed between day and night catches, the samples were therefore combined for evaluation.

46286. LEE, ARTHUR. British fishery research in the Barents Sea. (Polar record, May 1956. v. 8, no. 53, p. 109–117, maps.) 8 refs.

Account of investigations carried out during 1949-55 by the Arctic Team of the Fishery Laboratory, Lowestoft. Bjørnøya-Spitsbergen arc was surveyed almost exclusively, with primary attention to cod (Gadus callarias), with haddock (Gadus aeglefinus) and plaice (Pleuronectes platessa) occupying secondary place. The distribution as determined by oceanographic and environmental factors, migrations, plankton, also the fish stock as affected by trawling and climatic fluctuations, the benthos, etc. were studied and their bearing on fisheries evaluated. Copy seen: DLC.

**46287. LEE, DAVID C.** Supplying our arctic forces. (Army information digest, Jan. 1956. v. 11, no. 1, p. 26-29, illus.)

A popular account is given of the activities of the 7,278th GU Transportation Terminal Command of the U. S. Transportation Corps. This command controls unloading operations and port facilities at major Air Force installations in Greenland. Operations at Thule are simplified by the use of a DeLong pier; but at Sondrestrom Air Base, unloading must be accomplished by amphibious barges. Resupply operations from June-Oct. have to contend with ice, strong tides and currents, and poor beach conditions.

LEE, G. M., see U. S. Air Force. Air Weather Service. Studies...forecasting; Coral Harbor...1944. No. 48524.

46288. LEE, OWEN S. Local environmental factors affecting ice formation in Terrington Basin, Labrador. Washington, D. C., Dec. 1955. 29 p. 4 text charts, 13 graphs, 3 tables. (U. S. Hydrographic Office. Technical report, TR-24.) 3 refs.

Oceanographically, Terrington Basin (53°21' N. 60°23' W., at west end of Goose Bay) is a shallow basin in which advection plays an important part. After the Bay is frozen over, the thermohaline structure in the Basin becomes stable, with fresh water in the uppermost layers. Thus ice formation is similar to that in fresh-water lakes. Since standard methods of predicting ice formation and growth from the thermohaline structure cannot be used, ice forecasting becomes a one-parameter problem, with use of degree days of frost as the variable.

On the basis of data obtained from 32 oceanographic stations, Nov. 1–Dec. 9, 1953, mean date of ice formation was found to be Nov. 5, length of ice-growth season 149 days, and mean max. thickness of ice 31.8 in.

Description and preliminary results of a study of physical properties of sea ice made by the Hydrographic Office at Hopedale, Labrador (55°27′ N. 60°13′ W.), Jan.-May 1956, as part of a sea ice trafficability study. Ice salinity and temperature data were collected in Feb.-Apr.; during Apr.-May, disintegrating sea ice was photographed with movie camera. Data show that horizontal salinity variation is extremely complex. Vertically, a minimum salinity layer occurs in the middle layers of the ice and maximum variability at surface and bottom. The ice is permeable at temperatures above -8° C., and on clear days radiation is sufficient to raise temperatures above the figure. Ice is generally strongest at dawn, barring sudden air temperature changes. Copy seen: DN-HO.

A survey among native students aged 13-32 years showed 54 percent with subnormal vision for distance and 6.5 percent with corneal scarring. Myopia and myopic astigmatism affected 35 percent against 5 percent among the white population of the United States. Corneal scarring, its etiology and therapy are discussed in detail. *Copy seen:* DGS.

46292. Lefebre, Charlene Craft. A contribution to the archeology of the upper Kuskokwim. (American antiquity, Jan. 1956. v. 21, no. 3, p. 268-74, illus., map.) 5 refs.

Report on a fish camp site by Lake Telida (approx. 63°30' N. 152°30' W.) near the McKinley Fork of the Kuskokwim system, an area first explored by J. S. Herron's party in 1899 (cf. No. 18244). The site was excavated by a party of three in 1949. The material recovered is described and figured: adzes, scrapers, ulus (knives), projectile points, microlithic obsidian tools, bone awls, pottery fragments, etc., a complex characteristic of recent, prehistoric sites in Athapaskan territory excavated on the Yukon River. The Kuskokwim finds were made in a 6-12 in. deep hearth layer under a layer of sod 6-11 in. thick; they lay on sterile or sandy clay partly in permafrost ground which started at a depth of 17-20 in. Need for planned field work on the Kuskokwim similar to that on the Yukon (cf. No. 3535, 14115) is stressed. Copy seen: DLC.

46293. LEFFINGWELL, ERNEST de KOVEN, 1876— . A reconnaissance of the arctic slope of Alaska. (Washington Academy of Sciences. Journal, June 4, 1913. v. 3, no. 11, p. 343—44.)

Contains a summary of geological study of the region between Canning River on the west and Okpelak River on the east. Two provinces are recognized, the arctic mountains and the arctic slope, the latter divided into the Anaktuvuk plateau of Mesozoic and Tertiary rocks, and featureless coastal plain of Pleistocene rocks. The area of Anaktuvuk plateau was uplifted and base-leveled in late Pliocene or early Pleistocene times. The coastal plain was uplifted in the Pleistocene time.

46294. LE FLOCH, J. Quelques propriétés de la zone de transition entre eau Arctique et eau Atlantique en Mer de Norvège. Bergen, Sept. 1953. 45 p. 29 tables. (Bergen, Norway. Universitetet. Årbok; Naturvitenskapelig rekke, 1953. nr. 3.) 2 refs. Text in French.

Summary in English. **Title tr.:** Some properties of the transition zone between Arctic and Atlantic water in the Nor-

wegian Sea.

A study of daily oceanographic data obtained at Ocean Weather Ship "M" in the Greenland Sea (66° N. 2° E.) since 1948. Distribution of 'stations' occupied in the 5° square during each month is tabulated. Hydrological conditions in the vicinity are described, from observations Oct. 1948-Oct. 1950. Mean isotherms and isohalines are analyzed for this period showing variations with latitude, longitude, depth, season and year. Anomalies in the temperature/salinity relation are dealt with; also the distribution of temperature along the 35 percent isohaline and seasonal variations in its position relative to the 3° isotherm. The soundings of June 1951 and the temperature-salinity anomalies relative to surface salinity variations in June-July 1951 are analyzed. Copy seen: DWB.

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31–Nov. 2, 1956. Test drilling in permafrost on western edge of Mackenzie Delta disclosed some 40 ft. of organic silt, no sand or gravel. Intense frost action causes rapid mechanical weathering of material from adjacent mountains. Process is aided by turbulent stream action and annual growth of grasses on surface of

stream meanders. Decay of grasses plus annual layer of stream bed material results in organic silt rather than the usual muskeg of the North.

46303. LEĬZEROV, I. Severnym morskim putem. (Smena, Jan. 1956. god 33, no. 1, illus. (part color.), 4 plates between p. 12–13, map.) Text in Russian. *Title tr.:* On the Northern Sea Route.

Eight students of the Moscow Art Institute, with the author as instructor, made a summer (1955?) trip from Arkhangel'sk to Vladivostok on the dieselvessel Lena. The students' sketches (9 colored) are reproduced along with author's impressions of the trip: illusshow Provideniya Bay and Chukchi fishers' kolkhoz, etc. Copy seen: DLC.

46304. LELIKOV, A. E. Nekotorye voprosy ėkonomiki transporta severovostoka SSSR. (Rechnol transport, Aug. 1956. god 15, no. 8, p. 4–6.) Text in Russian. *Title tr.:* Some problems in the economics of transport in northwestern U. S. S. R.

In the industrial development of the Lena basin polymetallic ore deposit (especially tin) area, certain problems are encountered in shipping out ores and lumber and bringing in construction materials, food and fuel. Two main water routes are analyzed: one from the railroad town of Osetrovo down the Lena to the port of Tiksi, across the Laptev Sea and up the Yana to Verkhoyansk. The other route is from Murmansk via the Northern Sea Route to Nizhneyansk and up the Yana. The short summer shipping season and appreciably different depths along the waterway (entailing repeated unloading and reloading of cargos) present major mechanical and economic difficulties, particularly for petroleum and lumber. The high cost of petroleum transportation is due mainly to frequent reloading (15 times) of the barrels and to consumers' retaining about 50 percent of the barrels. The use of tankers is restricted by different water depths and by limited port facilities. Improvements toward solution of these problems are discussed in detail.

Gomoûnov. Moskva, Izd-vo Glavsevmorputi, 1944. 88. p. illus. tables, diagr (Its: Posobiâ i rukovodstva, vyp. 4.) Ref. Text in Russian.

Title tr: Instructions for observation of temperature, salinity, transparency and color of sea water. Prepared by

K. A. Gomoûnov.

Contains brief description of the instruments and detailed procedure for obtaining consistent observations. The Zubov reversing thermometers are described with illus.; also bathometers of the International Hydrographic Laboratory, Nansen and Knudsen bottles for obtaining water samples from the deep layers; and the Secchi disc for transparency observations of surface water. The depth of submerged instruments are corrected (tables) for curvature of the cable.

Appended are sample recordings of deep-water observations from the Smol'ny' in Bering Sea, 1941, and preliminary analysis of the temperatures taken.

46308. LENINGRAD. ARKTICHESKIĬ NAUCHNO-ISSLEDOVATEL'SKIĬ INSTITUT. Instrukſsiß po proizvodstvu khimicheskikh issledovaniI morskoI vody. Sostavili S. V. Bruevich i S. K. Demenchenok. Moskva, Izd-vo Glavsevmorputi, 1944. 84 p. illus., tables, graph, (Its: Posobiß i rukovodstva, vyp. 7.) 52 refs. Text in Russian. Title tr: Instructions for chemical analysis of sea water, S. V. Bruevich and S. K. Demenchenok compilers.

Various practical methods and equipment for collection, storage and analysis of sea-water samples at polar stations are described in detail. Micro-method of determination of salinity (chlorine) is adopted in preference to the More-Knudsen method. Practical reagents, equipment and formulas are outlined for different analyses. Determination of dissolved oxygen content, carbon dioxide, alkalinity and pH (hydrogen ion concentration) are described in separate chapters.

Botanist's account of his trip in the northeastern part of the Kolyma River basin. He traveled with an expedition from Moscow (in spring 1937) by train to Vladivostok, thence by steamer (the Ermak) via Bering Strait to Ambarchik, and by river boat up the Kolyma and Omolon to the Bol'shoy Oloy River (66°08' N. 160°28' E.). There he left the party and accompanied Yukaghirs and their reindeer herd; later he pushed on by dog-sledge along the northwestern slopes of Kolymskiv Khrebet (Gydan), and on Dec. 31 he reached the expedition base at the town of Ostrovnoye (approx. 68° N. 164° E.) on the Malyy Anyuy River. In the course of his narrative, writer describes his means of transportation, routes (map, p. 63) and events of the trip, also the settlements, such physical features as rivers, mountains, and landscape generally; large river naleds are noted (p. 162, 165). vegetation of the area traversed, from the coastal tundras to the forests on the upper reaches of the Omolon River and its tributaries, is treated in detail. Birds, includ-

71

ing swans, geese, ducks are noted, also encounters with bears, arctic fox, wild reindeer, wolverine and other animals. Hunting and trapping, living conditions of the Yukaghir reindeer breeders and seasonal migration of their herds are described. Botanical notes are scattered throughout the text, with emphasis on reindeer pastures and lichens. A list (Russian and Latin names) of 163 plants mentioned in the text is appended (p. 178 - 82). 46328. LEVIN, MAKSIM GRIGOR'E-VICH, 1904— Antropologicheskie tipy Sibiri i ikh genezis. Moskva, Izd-vo Akademii nauk SSSR, 1956. 27 p. (Doklady sovetskol delegasii na V mezhdunarodnom kongresse antropologov i étnografov.) 6 refs. Text in Russian and French. Title tr: Anthropological types of Siberia and their genesis. (Papers presented by the Soviet delegation at the Fifth International Congress of Anthropological and Ethnological Sciences.)

Content is substantially the same as No. 46327 with an added discussion of the "Americanoid" types in the population of Siberia and the Far East. Author considers this type to be a variation and a definite (ancient) stage in the development of the Mongoloid race resulting from an admixture of an Europoid

element. Hrdlička's work is noted and attempts at racial classification by Haddon and von Eickstedt are criticized. *Copy seen:* DLC.

46329. LEVIN, MAKSIM GRIGOR'E-VICH, 1904— Antropologicheskii material iz Verkholenskogo mogil'nika. (Akademiña nauk SSSR. Institut étnografii. Trudy, 1956, nov. serifa, t. 33. Antropologicheskii sbornik, no. 1, p. 299—339, illus., tables.) 15 refs. Text in Russian. Title tr. Anthropological material from the Verkholensk burials.

Discusses the neolithic and bronze age skeletons (now at the Museum of Anthropology and Ethnography, Leningrad) found on the right bank of the Lena River by the 1950 Buryat-Mongolian and the 1951 Angara archeological expeditions, both headed by A. P. Okladnikov. The burials belong to the early-Serovsk and Glazkovsk (4th-3rd, and 2nd millenium B. C.) stages and differ in funeral inventory as well as in the orientation of the skeletons: east-west for the Serovsk, north-south for the Glazkovsk period. Each burial (four excavated in 1950 and 31 in 1951) is described in turn, and the racial affinities to the Mongoloids, Amerindians and Europeans are analyzed. Detailed cranial measurements are given and the individual skeletons compared with each other, with other pre-historic Baykal finds, and with the contemporary Tungus, Yukaghirs, Eskimos, Chukchis, Copy seen: DLC.

46330. LEVIN, MAKSIM GRIGOR'E-VICH, 1904— . Éveny. (*In:* Akademiâ nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 760–75, illus., col. plate.) 11 refs. Text in Russian. *Title tr.:* Lamuts.

Sketches their distribution (70°-50° N. 125°-175° E.) material culture, population (approx. 7,000 in 1926). cultural and linguistic affinities between them and the Evenki, another Tungus people, are noted. The economy of the nomad hunters and the settled fishermen, their trade relations, dwellings (polereinforced tents), food and clothing are sketched. Their tribal and family organ-(patriarchate, relative indeizations pendence of women, marriage customs), religious beliefs and folklore are discussed. The economic and cultural advances; during the Soviet regime are described; creation of kolkhozes, introduction of agriculture and animal husbandry, settling of nomad hunters, etc. The collaboration of B. A. Vasil'ev is acknowledged.

Trudy, 1953. vyp. 23, Istoriko-bytovye ékspedifsii 1949–1950. p. 92–140, illus.) 33 refs. Text in Russian. Title tr.: The material culture of the Russian North in the late 19th—early 20th century; the Kargopol' expedition of 1950.

The expedition, headed by the author, studied the monuments and articles of handicraft reflecting the economic and social changes during the time of expanding capitalism in the Arkhangel'skaya Oblast'. Kargopol' (approx. 61°30' N. 38°50' E.) and the villages located on the Petersburg-Arkhangel'sk trade route were investigated. The importance of local and foreign trade contributing to the rise of a wealthy middle-class is stressed. Local crafts (lumbering and wood carving, fur and leather goods production, weaving, etc.), developed to supplement meagre agricultural yields, and their products, disposed of at annual fairs, are discussed; some occupational statistics are given. Village planning, log houses, household furnishings, clothing styles, etc., are described. The progressive decline of craftsmanship due to the rise of industrialization is noted.

46333. LEVINSON-LESSING, FRANTS TUL'EVICH, 1861–1939. Ocherednye problemy Khibinskogo massiva. (In: Fersman, A. E. Za poliārnym krugom, 1932. p. 23–26, illus.) Text in Russian. Title tr.: Current problems of the Khibiny massif.

Discusses problems disclosed by work of the "tectonic party" headed by the author in 1932 (cf. No. 47296). Are the apatite veins the result of differentiation of the original magma, or are they a result of a later new intrusion? What is the age relation of the apatites to other rocks, especially to hornstone? What was the direction of the intrusion, vertical from below, or lateral from the east, where the alkaline granites might have been the focus of intrusion? Need of further investigation for answering these questions is stressed.

Microscopic and spectral studies of comparatively small dikes of porphyrite, containing dark leaves of mica are described in detail. The results of analyses and comparison with petrographic characteristics of Siberian traps are presented in tables and macrophotographs. Macroscopically, porphyrite is represented by aphanitic rocks with lustrous scales of biotite mixed with zeolites. A thin section of biotite shows inclusions of pyroxene, titanomagnetite, rutile and apatite. The chemical and optical characteristics of various samples are tabulated. Copy seen: DLC.

46345. LIAKHOVICH, V. V. O pizolitovykh tufakh na Sibirskoĭ platforme. (Akademiía nauk SSSR. Doklady, Sept. 1, 1956. t. 110, no. 1, p. 137-39, illus., plate.) 9 refs. Text in Russian. Title tr.: On pisolite tuffs of the Siberian platform.

Tuffs observed in the region of the Podkamennaya and Nizhnyaya Tunguska Rivers, also the Chon, in Krasnoyarskiy Kray, are volcanic in origin. They enclose so-called pisolites, or small (2-4 mm.) globular concretions consisting of quartz, plagioclase and grains of pyroxene of various colors: yellow-gray, bluegrayish or brick-red. The origin of pisolites is uncertain but three ways of their formation are suggested: from rain droplets falling into loose volcanic ash and forming dusty globules; (2) from rain drops passing through atmosphere filled with volcanic ash; (3) from the condensation of vapor around ash grains in an eruptive cloud. The presence of volcanic tuffs on the Siberian platform is proof of intensive volcanic activity in this region in the past.

The region studied is on the Norwegian coast, approx. 69° N., Andørja and Rolla are two large islands off the mainland, outside Gratangen, a branch of Astafjorden. Sketch of its geography is followed by discussion of glacial striae, moraines and shorelines. At maximum extension of the last age, the mountains inland of Troms as well as those of Andørja and Rolla were under ice. Melting began with a retreat of the ice, but a colder period caused two new advances. The phases of these transgressions and regressions and corresponding moraines and shore lines are shown on fig. 7–8.

46359. LINDBERG, GEORGII USTI-NOVICH. Chetvertichnyi period v svete biogeograficheskikh dannykh. Moskva, Izd-vo Akademii nauk SSSR, 1955. 334 p., maps, incl. fold. map, 27 tables, 381 refs. Text in Russian. *Title tr.:* The Quaternary period in light of biogeographical data.

The geological history of fauna (fishes) is outlined for Okhotsk and Bering Seas, in relation to changes of ocean level (regression and transgression) as reflected in analysis of fresh-water fishes of Alaska (Yukon), the Chukotsk Peninsula, Amadyr and Kamchatka River systems (fig. 13). Six hypotheses on the origin of underwater valleys and canyons, including the relief of the Bering Sea are

analyzed in addition to the hypotheses on catastrophic variations in ocean levels. Vibratory motion of the world ocean levels is discussed with consideration of changes due to movement of water masses (hydrocratic), due to vibration of the earth's crust (geocratic) and due to thawing and accumulation of ice (hydroeustatic). History of formation of the river basins in the western Siberian lowland is outlined in detail for Kara Sea, Ob', Irtysh, Yenisey, etc. Practical significance will be in the synchronization of known transgressions and regressions of various Russian seas (North, Baltic, White, Barents and East Siberian Seas). This synchronization will give the basis for stratigraphy of Quaternary deposits related to hydrogeocratic variations of world ocean levels. Copy seen: DLC.

46360. LINDBERG, GEORGIĬ USTI-NOVICH. K chetvertichnol istorii dal'nevostochnykh morel. (Akademila nauk SSSR. Doklady, Nov. 11, 1956. god 24, t. 111, no. 2, p. 422-24.) 3 refs. Text in Russian. *Title tr.:* On the Quaternary history of the Far Eastern seas.

That no less than three transgressions and regressions of the ocean took place in the Far East during the Quaternary period, is offered as an hypothesis tenable from the biogeographic and paleontological viewpoints. Analysis of the relationship and distribution of fishes of the Far Eastern seas and data of diatom analysis in the Bering and Okhotsk offer conclusive evidence of oceanic fluctuations. The "geohydrocratic hypothesis" seems to merit acceptance as a good working theory for study of the Quaternary history of the region. Copy seen: DLC.

46361. LINDBERG, GEORGII USTI-NOVICH, and M. I. LEGEZA. O dvukh formakh kolûchel akuly Squalus acanthias L. (Zoologicheskil zhurnal, Nov. 1956. t. 35, vyp. 11, p. 1685–88, 2 illus.) 6 refs. Text in Russian. Title tr.: On two forms of the spring dogfish, Squalus acanthias L.

Two forms are differentiated and discussed, and measurements given, partly on the basis of specimens from the Barents (Teriberka, Murman), White and Okhotsk Seas.

Copy seen: DLC.

1948. p. 471-81, illus., maps.) 16 refs. Text in Swedish. *Title tr.:* Northern and southern elements in the insect fauna of coastal waters.

Along coasts where land has risen in recent geologic time, rock basins containing water the year round also contain forms of aquatic life whose character changes with that of the water. basins are low enough to receive some salt water from high waves, the water is brackish. Those beyond wave reach become filled with vegetation. Small basins with white moss now high in elevation, were once vegetationless and at strandline. Local climate also influenced the life forms. The youngest, lowest, basins are occupied by a limited range of higher vegetative and biologic forms. The older ones, with richer vegetation and bottom sediment, are more complicated biotopes. Study of stone basins in Fennoscandia reveals two distribution groups; one in the Arctic, sub-Arctic, and northernmost part of the coniferous forest and the higher alpine and subalpine belts. The second group is in southern and central Fennoscandia, and in this group the northern forms are relicts, or pseudo-relicts, where conditions have changed little from those of northern Copy seen: DLC. group.

46363. LINDBERG, HARALD, 1871— Die Früchte der Taraxacum- Arten Finnlands. Helsingforsiae, 1935. 22 p. illus. (331 fig.) on 38 plates. (Acta botanica fennica, no. 17.) 41 refs. Text in German. Title tr.: The fruits of the species of Taraxacum in Finland.

Contains information on the taxonomy of this genus of herbs, of which the dandelion is best known and on the distribution of its forms in Finland. Their only reliable taxonomic criterion is the fruit; its characteristics are presented in the main Taraxacum groups, and instructions given for collecting it. This textual part is followed by illustrations of fruit from 331 species, including those of Lapland.

Copy seen: DLC.

46364. LINDBERG, HARALD, 1871—. Släktet *Meligethes* (Col.) i Fennoscandia orientalis. (Notulae entomologicae, 1956. v. 36, no. 3, p. 72–76.) Text in Swedish.

Title tr.: The genus Meligethes (Col.) in eastern Fennoscandia.

Host plants and localities are listed for 25 species of this beetle. Three occur in the far North: M. atratus in Kuusamo and Finnish and Russian Lapland; M. aeneus at Kuusamo and Rovaniemi; and M. viduatus at Rovaniemi and Kemijärvi.

Copy seen: MH-Z.

46365. LINDELL, BÖRJE. Första fjällveckan. (Svenska turistföreningen, Stockholm. Årsskrift, 1954. p. 261–69.) 6 illus. Text in Swedish. *Title tr*: The first week in the mountains.

Describes a walking tour in the fall, from near Jokkmokk, beyond Sarek, in the direction of Kebnekaise, in northern Swedish Lapland, interrupted when snowstorms shut in the higher Kebnekaise district. The daily marches, landscape, etc., are noted, also huts, provisions, and other accommodations available.

46366. LINDENBERG, A. B., and M. MASSIN. Influence de la température sur la statique et la cinétique de la pénétration cellulaire de l'urée, de la thiourée et de la sulfanilamide. (Journal de physiologie, 1956. t. 48, no. 3, 616–18, tables.) Ref. Text in French. Title tr.: Influence of temperature upon the statics and kinetics of cellular penetration of urea, thiourea and sulfanilamide.

The reported experiments were conducted with yeast cells in a temperature range of 3° to 30° C. The preferential solubility of the aqueous-cellular medium decreased with falling temperature. The speed of penetration of the three substances also fell at low temperatures. The molecular and energy aspects of these phenomena are discussed.

46368. LINDHAGEN, SVEN ALBERT, 1896– . Från Pava-Lasse till Mora-Nisse. Stockholm, Tidens förlag, 1953. 334 p., illus. Text in Swedish. *Title* tr.: From Pava-Lasse to Mora-Nisse.

The story of skiing as a Swedish sport, from the time of Pava Larsson (Lasse) Tuorda, a Lapp, who won the first organized ski meet in 1884, to Nils Karlsson (Mora-Nisse) recent (1943-51), famed champion. Leading Swedish skiers and Sweden's place in skiing as an international sport are discussed. Appended is a list of Swedish winners of events in Olympic, Holmenkollen, and other international meets after 1927. Swedish Lapland and Lapps figure prominently, especially in the earlier history.

Copy seen: DLC.

46369. LINDMAN, CARL AXEL MAGNUS, 1856–1928. Om drifved och andra af hafsströmmar uppkastade naturföremål vid Norges kuster. Göteborg, 1883. 106 p. incl. 3 plates, tables. (Göteborgs kungl. vetenskaps- och vitterhets-samhälle. Handlingar, ny tidsföljd, häft. 18.) Text in Swedish. Title tr.: On driftwood and other natural objects east up by ocean currents on the coast of Norway.

The driftwood on arctic coasts is transported thither from its native locations by ocean currents. The current off Norway's coast is the strongest entering the Arctic; deposits are common along the entire coast, greatest in Lofoten and Troms, and localized to special strands. Scientific names and other information are provided for coniferous and deciduous are provided for coniferous and deciduous the species whose fruit and seeds have been gathered. Copy seen: DLC.

46370. LINDQVIST, EITEL. Revision einiger von schwedischen Entomologen beschriebenen Nematinen: Hym. Tenthredinidae. (Opuscula entomologica Jan. 31, 1956. bd. 21, häfte 1, p. 8–14, illus.) 14 refs. Text in German. *Title*  tr.: Revision of some Nematinae (Hym. Tenthredinidae) described by Swedish entomologists.

Deals with present taxonomic status of various species of this subfamily; geographic distribution is given in only a few cases. Pristiphora flavipes is recorded in Senjen Island, in the vicinity of Tromsø, northern Norway.

Copy seen: DA.

46371. LINDROTH, CARL HILDE-BRAND, 1905- . Die fennoskandischen Carabidae, eine tiergeographische Studie. I, spezieller Teil; II, die Karten; III, all-Teil; zugleich eine biogeogemeiner graphische Prinzipdiskussion. Göteborg, Wettergren & Kerber, 1945–1949. 3 v.: 709 p., map.; 277 p., 338 text maps; 911 p., 118 illus. incl. text maps, 61 diagrs., 38 tables. (Göteborgs K. Vetenskapsoch vitterhets-samhälle. Handlingar, 6 följden, ser. B, bd. 4, no. 1–3.) Approx. 500–800 refs. Text in German. Summary in English (in pt. 3, p. 813-42). Issued also as "Meddelanden från Göteborgs Musei Zoologiska Avdelning, 109, 110 and 122." Title tr.: Fennoscandian Carabidae, a zoogeographic study. 1, special part; 2, maps; 3, general part; together with a discussion of biogeographical principles.

Basic work, of which the first two parts, published in 1945, offer "a full account of the distribution, ecology, biology and dynamics (i. e. power of dispersal) of every species of the Carabidae, 361 in number, occurring in Fennoscandia. Distribution maps (pt. II) are given for nearly all of them. The . . . third part of the work deals with the material from the general point of view, with the chief purpose of elucidating the glacial and postglacial history of the Fennoscandian fauna."—from summary, p. 813.

The introductory section discusses modern insect systematics, use of literature and various technical terms (synöcology, syngeography); it is followed by an analytic section dealing with methods of investigation, influence of environmental factors and selection, distribution of dimorphic forms, etc. In the synthetic section "existence factors" are studied: climate, temperature, precipitation and humidity, ground, etc., as well as nutriment, competition; also such dynamic factors as flight power, wind dispersal, water dispersal, etc. History of the fauna is treated: its changes in recent times, fossil finds, relicts, postglacial immigration and the problem of "Würm, i. e., the last glaciation, hibernation." Many arctic species are included, as the work covers in its broad scope, Norwegian, Swedish, Finnish and Russian Lapland, also Karelia, the White Sea coast. Supplemental data to pts. 1-2 is given on p. 843-69 of pt. 3.

46372. LINDSKOV HANSEN, JO-HANNES, 1907— . Gensyn med Grønland. København, Munksgaard, 1952? 27 p., illus. Text in Danish. Title tr.:

Seeing Greenland again.

After two visits to Greenland, in 1946 and 1952, this Danish author writes of Greenland's experience of being cut off from Denmark during World War II, and the differences noted in activities during the six-year interval. The first journey seemed an adventure, the second a business trip. Danes migrating to Greenland are changing in their attitude toward its colonialism; many favor permanent immigration and a future in Greenland. Illustrated by drawings of Ernest Hansen. Copy seen: DLC.

46373. LINDSTRÖM, MAURITS. Structural geology of a small area in the Caledonides of arctic Sweden. Lund, 1955. 32 p. 19 illus., 4 maps. (Mineralogisk- och paleontologisk-geologiska institutionerna, Skrifter, nr. 27) Also issued as: Lund. Universitet. Aarsskrift,

bd. 51, nr. 15. 18 refs.

Bedrock over an area of approximately 8 km², at the northwestern end of Lake Torneträsk near the Norwegian frontier, was studied in an attempt to ascertain its structural history. The general sequence of rocks is described. It appears that a dome of the Archean basement is free here of overlying rocks. Eastward and westward the rock sequences rise, to the west at the rate of 100 m.: km. After field investigation and mapping, thin sections were examined. It is concluded that three and possibly four phases of deformation took place in the overthrust Caledonides. Copy seen: DGS.

Contains (in pt. I) descriptive and critical notes on about 40 species, of which one and a subspecies are described as new, and another, Cicadula ossiannilsson, occurs in Finnish and Russian Lapland. Pt. II deals with nine species, one of them new to science and four to Finland. Typhlocyba soror n. sp., Coriomeris scabricarnis and Psammolettix albomarginatus, all collected in the Oulankajoki River basin in the Kuusamo region, are included.

Copy seen: DLC.

46379. LINNAVUORI, RAUNO. On some new or interesting leafhopper species of the family Cicadellidae. (Suomen hyönteistieteellinen aikakauskirja, 1953. v. 19, no. 2, p. 56-63, 3 illus.) 5 refs.

Lists, with notes, 15 species from various regions; two genera, seven species and a variety described as new. Sorhoanus medius from Ust Aldan on the Lena River and Diplocolenoidea perexigua n. sp. from Yakutsk, are included.

Copy seen: DLC.

46380. LINNAVUORI, RAUNO. Some interesting beetle finds from Finland. (Suomen hyönteistieteellinen aikakauskirja, 1953. v. 19, no. 3, p. 134–36, illus.) 6 refs.

Lists seven species. Proteinus apicidens, previously known only from northernmost Lapland (Inari and Enontekiö regions), is recorded at Ylivieska, Raudaskylä; and Tachinus atripes (male) is described from Lapland.

Copy seen: DLC.

46381. LINNÉ, S. The Bering isthmus, bridge between Asia and America. (Ethnos, 1955. v. 20, no. 4, p. 210–15, illus., diagr., map.) 3 refs.

Discusses the migration route theories, favoring the hypothesis of a crossing over a land bridge that connected the two continents during the glacial and probably also the postglacial periods. Data on distances and bottom profile of the Strait are given, the present sea level compared with that during the ice age, and the discovery of the strait by S. I. Dezhnev (1648) and V. Bering (1728) mentioned.

Copy seen: DLC.

46382. LINNIK, E. Éskimosy. (Vokrug sveta, Aug. 1956, no. 8, p. 22–23, illus.) Text in Russian. *Title tr.:* Eskimos.

Popular sketch of Eskimos in America and Greenland: their hunting, kayaks and umiaks, dwellings; their carving, mapping, acculturation.

Copy seen: DLC.

46383. LINTON, EDWIN, 1855–1939. Notes on cestode parasites of sharks and skates. (U. S. National Museum. Proceedings, Oct. 27, 1924. v. 64, art. 21, no. 2511, p. 1–119, 13 plates.) 29 refs.

Contains a critical study of 71 species of selachian cestodes, nine described as new; based chiefly on material obtained by the Laboratory of the U. S. Bureau of Fisheries, Woods Hole, Mass. Monorygma perfectum found in the stomach of a sleeper shark, Somniosus brevipinna, (p. 16-19) Moser Bay, Alaska, in 1903, is included.

Copy seen: DLC.

46384. LINTVAREV, V. Ezdovye laĭki Nizhne-Kolymskogo raĭona. (Okhota i okhotnich'e khozíāistvo, Dec. 1956, no. 12, p. 27–29, illus.) Text in Russian. Title tr.: Draught dogs in the Nizhne-Kolymsk District.

Siberian huskies of the lower Kolyma, Yana and Indigirka River basins are ranked among the best draught dogs in the world, and the Nizhne-Kolymsk District is the main source of supply for other northern areas. The dogs are notable for their endurance: making 40-60 km. in winter at —40° to —50° C., they need only 1.5 kg. of fish per day. Some shortcomings in breeding them are mentioned: castration of male dogs, crossing with other and poor strains, etc., and measures are discussed for keeping the race pure.

Copy seen: DLC.

46385. LIPSHITS, B. A. Étnograficheskie issledovanifâ v russkikh krugosvetnykh ékspedifsifakh pervof poloviny xix v. (Akademifa nauk SSSR. Institut étnografii. Title tr.: Ethnographic investigations of the Russian expeditions around the world in the first half of the 19th century.

Includes (p. 302-310) the studies on Kamchadals, Chukchis, Eskimos, Aleuts, Tlingits, etc., made by Russian explorers of northeastern Asia and Alaska. The works of IU. F. Lisfanskii on the Koniags (Eskimos) of Kodiak and the Tlingits of the Sitka region, O. E. Kofsebu on the Eskimos of northwest Alaska, F. P. Litke's description of the marriage customs (exogamy), religious beliefs, blood feuds, etc., of the Tlingits, and the investigations conducted on Kamchatka by G. I. Langsdorf, V. M. Golovnin, et al. are Early observations on the discussed. trade relations, cultural affinities, etc., between Alaskan Eskimos and Chukchis are noted. The 19th century ethnological errors due to over-emphasis of certain linguistic similarities and classifying of Chukchis as Eskimos are analyzed.

Copy seen: DLC.

46386. LIPSHITS, B. A. L. A. Zagoskin, kak issledovatel' étnografii Alıâski. (*In:* Zagoskin, L. A. Puteshestviß i issledovaniß, 1956. p. 385–98, port., map.) 20 refs. Text in Russian. *Title tr.:* L. A. Zagoskin, explorer of ethnography in Alaska.

Contains outline of Zagoskin's views on the objectives and method of ethnographic studies; with a summary of his exploration of Eskimo and Indian tribes in Alaska during his "pedestrian" expedition to Yukon and Kuskokwim River basins in 1842–1844. The scientific importance and lasting value of his work is stressed. Copy seen: DLC.

46387. LIPSHITS, B. A. O kollektsiiākh Muzeta antropologii i ėtnografii, sobrannvkh russkimi puteshestvennikami i issledovateltāmi na Altāske i v Kalifornii. (Akademitā nauk SSSR. Muzet antropologii i ėtnografii. Sbornik, 1955. t. 16, p. 358–69, illus.) 18 refs. Text in Russian. Title tr.: The collections of the Museum of Anthropology and Ethnography, gathered by Russian travelers and explorers in Alaska and California.

Describes objects, collected by: G. I. Sarychev and J. Billings (1785), ÎU. F. Lisânskil, F. P. Litke, V. M. Golovnin, I. G. Voznesenskil, L. A. Zagoskin, A. F. Kashevarov and K. T. Khlebnikov during the time of the Russian-American Co. (1797–1867), and the missionary G. Chudnovskil (1891). The bulk of the collections, over two-thirds of the ethnographic material contributed by I. G. Voznesenskil, came from Alaska and the adjacent islands and consists of: wearing apparel made of fur, skin, and marine mammal intestines (kamleâ), ceremonial and war masks, wood and bone implements, and boats (baldarka). Aleut,

Eskimo and Indian work are all represented. The individual collections, the number of items in each, and some facts pertaining to their acquisition are discussed. Photographs illustrate some 70 of the objects, several of the masks quite clearly. The Museum of Anthropology and Ethnography of the Academy of Sciences is in Leningrad.

Describes the construction of the first Ob' hydro-electric station, near Novosibirsk, and the heroic effort to save the almost completed dam during a storm.

Copy seen: DLC.

46396. LISOVSKIĬ, KAZIMIR. Taina mysa Vkhodnogo. (Sibirskie ogni, Sept.— Oct. 1956. god 35, no. 5, p. 131–48, illus.) Text in Russian. *Title tr.:* The mystery of Cape Vkhodnoy.

On his last hunting trip, N. A. Begichev wintered with his party on Cape Vkhodnoy (approx. 74° N. 81° E.) at the entrance to Pyasina Bay; there he died on May 18, 1927, and was buried in the vicinity. Persistent rumors that he was killed by one of his companions, who later married his widow, induced the author to investigate the case. In 1951 he visited Cape Vkhodnoy and found Begichev's grave. An autopsy disclosed no evidence of murder or violence and the authorities came to the conclusion (not shared by the author) that Begichev succumbed to scurvy. The story of the investigation is

recounted at length; the places visited, among them Dudinka, Noril'sk, Taymyr Peninsula, Pyasina River and Cape Vkhodnoy, are described; Begichev's achievements and his fame in the North are noted; and the companions of his last trip, including two natives (Tungus and Samoyed) are characterized.

LISTER, H., see Hamilton, R. A., and others. British North Greenland Expedition, 1952–4 . . . results. 1956. No. 45412.

46397. LITTLE, C. GORDON, and others. Radio wave propagation in the Arctic. College, Alaska, 1956. 111 l. diagrs., graphs, tables. (Alaska. University. Geophysical Institute. Final report under contract no. AF 19 (604)–1089, covering period April 15, 1954 to April 15, 1956.) Research sponsored by the U. S. Air Force Cambridge Research U. S. Air Force Cambridge Research Center, Air Research and Development Command. AFCRC-TR-56-121.

For study of tropospheric and ionospheric radio propagation, research was undertaken on sweep frequency, ionospheric back scatter, auroral and meteor echoes at frequencies of 50 mc and higher, microwave propagation, prediction of auroral and ionospheric storms, whistlers, mountain scatter and defraction at VHF, ionospheric absorption, and assistance to the Alaska Air Command on problems of radio propagation. Sweep frequency observations of back scatter from auroral ionization were not made because of lack of equipment. Studies of auroral and meteor radar echoes, on the prediction of auroral and ionospheric storms, on whistlers, and on the scattering and defractions of VH waves by mountains are reported in detail.

Continued research is recommended, particularly on sweep frequency, ionospheric back scatter, auroral and meteor echoes, and in the prediction of auroral and ionospheric storms.

46398. LITTLE, C. GORDON. Radio wave propagation in the Arctic. Interim scientific report no. 1, for period April 15, 1954, to July 15, 1955. AFCRC-TN-55-579. Cambridge, Mass., Air Force Cambridge Research Center, Aug. 15, 1955. 74 l. illus., diagrs., map. (Its: Air Force Research Contract no. AF 19 (604)-1089.) 23 refs.

Alaskan studies are being conducted on

tropospheric and ionospheric modes of propagation in an effort to improve communication systems. An SCR-270 radar was modified for auroral radar research, and two main investigations were made with this equipment. One was to determine the mode of propagation of VHF auroral echoes; the results indicated that a strong aspect sensitivity existed because of the auroral ionization being aligned along the lines of force of the earth's magnetic field. The second investigation showed that the radar echoes are usually closely associated in range and azimuth with the visual aurora, but that the visual brightness of the aurora is not the factor controlling the strengths of the echoes. No echoes were obtained at ranges greater than 106 mc, owing to lack of suitable equipment. Observations conducted on a microwave link showed the absence of significant tropospheric refraction effects. Development was largely concentrated on equipment for a better understanding of the aurora. The equipment consisted of an all-sky camera and a photoelectric photometer. Tape recordings of whistlers are being analysed to determine their frequency dispersion. Three main phases of additional work were conducted dealing with the tropospheric propagation of VHF radio waves, the diffraction and scattering of VHF radio waves by mountains, and the absorption of HF radio waves of the ionsphere.—AD abstract. 46399. LITTLE, C. GORDON, and others. Review of ionospheric effects at VHF and UHF. (Institute of Radio Engineers. Proceedings, Aug. 1956, v. 44, no. 8, p. 992–1018.) 182 refs. Also pub. as: Alaska, University, Geophysical Institute, Contributions, Ser. B, no. 13. Other authors: W. M. Rayton and R. B. Roof.

Contains a comprehensive summary of known effects except forward scattering of VHF by the ionosphere, but including, among others, radar echoes from aurora and radio noise of auroral origin. The subject of echoes from aurora is subdivided into the following subtopics: relation of radar reflections and visual aurora; aspect sensitivity; frequency dependence; diurnal variation of auroral echo activity; seasonal variation of auroral echo activity; polarization of auroral radar echoes; height of scattering centers responsible for auroral echoes; range distribution of auroral echoes;

range drifts of auroral radar echoes; frequency spectrum of aurorally-scattered radio waves; amplitude distribution of auroral echoes; latitude distribution of auroral echoes; and effective scattering areas of aurora. Radio noise of auroral origin is discussed under general considerations and experimental results. Brief mention is also made of meteor echo observations made at high latitudes effects on the absorption of radio waves by the A list of agencies active in ionosphere. VHF-UHF ionospheric studies is in-Copy seen: DLC. cluded.

A brief history is given of oceanographic research sponsored by the Danish Ministry of Fisheries, and the current and future research program is described. The research vessel currently employed, the Dana III built in 1938 and rebuilt in 1949, is a single screw ship of about 500 tons, powered by a 700-hp. diesel engine, with quarters for a scientific complement of six. Her hydrographic and trawling equipment, laboratory facilities are noted. Work of the 1946-1948 and 1950 cruises is noted; program of 1951-54 is reviewed and hydrographic stations taken each year are mapped. They include the North Sea, the herring area north of the Faeroes, and the West Greenland Current area. Copy seen: DLC.

46407. LIZARDI ALBARRÁN, FER-NANDO. Las regiones árticas en la geopolítica y en las relaciones internacionales. México, 1950. 153 p. Thesis, Universidad National Autónoma de México. Text in Spanish. *Title tr.*: The arctic regions in geopolitics and international relations.

Diversity of viewpoints on economic, political, military and juridical questions with respect to the arctic regions and their control, to unoccupied or temporarily occupied territory, is stressed. views are outlined on property rights and control, and on juridical recognition of discovery, occupation, and accession as applied to arctic lands contiguous with continental nations of Canada, Norway. and Russia: the somewhat different position regarding the outlying islands of Greenland and Spitsbergen is noted. The geopolitical concepts derived from the teachings of Mahan, Mackinder, Ratzel are reviewed, and the recent intensification of nationalism is discussed. Differences between geopolitical and juridical points of view on such concepts as arctic, control of open sea, and sectors. are analyzed. The processes of international jurisprudence are preferred to geopolitical developments for determinations on rights or occupance of unoccupied areas. Copy seen: DLC.

46408. LJUNGNER, ERIK, 1892–1954. East-west balance of the Quaternary ice caps in Patagonia and Scandinavia. (Upsala. Universitet. Mineralogisk-geologiska institut. Bulletin, 1949. v. 33, p. 11–96, 10 illus., 12 diagrs., 17 maps.) 254 refs.

Includes analysis of geomorphic effects of ice sculpture in glacial time on marine and continental slopes of Scandes mountains. Traces of varying directions of ice movement in the lower Arctic of Scandinavia are related to development of cirques, tinds, valleys, fjords and finger lakes, to cyclic elements in landscape features, to differences between maximum Norwegian maritime and Scandinavian continental glacial activity, and to changes in character of atmospheric circulation patterns and in nature of the Gulf Stream.

Copy seen: DLC.

46409. LJUNGNER, ERIK, 1892–1954. Urbergsytans form vid fjällranden. Surface form of the crystalline basement at the eastern margin of the Scandes. (Geologiska föreningen, Stockholm. Förhandlingar, 1950. bd. 72, häfte 3, no. 462, p. 269–300, illus., text map, 7 diagrs.) 58 refs. Text in Swedish. Summary in English.

Borings and surface observations along the border of Caledonian folding in northern Sweden provide material on which are postulated the nature of the pre-Cambrian peneplane and post-Cambrian tectonic activity, the nature and extent of the early-Paleozoic geosyncline and its relation to the surrounding area, and flexure, nappe, and fold development in relation to possible land bodies of the time. The observations and interpretations of this study, made just south of the Arctic Circle, are applicable as well to the area to the north. Reference is made to interpretations in the Sarek locality.

46411. LLOYD, TREVOR, 1906—. The fishing industry of North Norway. Hanover, N. H. Dartmouth College, Jan. 1956. 33 p. 9 text maps, graphs, 20 tables. Mimeographed. (Technical report ONR 438-03-05.) 20 refs.

Reconstruction of the fishing industry of Finnmark and north Troms after World War II has provided opportunities for modernization. Physical conditions governing size of catch in the area are briefly discussed; type and distribution of fish are noted, the herring and cod most important commercially. Considerable seasonal fluctuations occur in the industry, busiest in spring and winter, quietest in summer. Seasonal and areal distribution of fish are reported; also tonnage and value of the catch, labor supply, vessels and equipment, methods of fish processing, distribution of processing plants, marketing. The Vardø fishing industry of east Finnmark (70°22' N. 31°07' E.) is described and a list of fish types (Norwegian, Latin, English names) appended. Copy seen: CaMAI.

46412. LLOYD, TREVOR, 1906— Norwegian collaboration in the economic development of arctic Finland. Hanover, N. H. Dartmouth College, Jan. 1956. 11p. 3 text maps. Mimeographed. (Technical report ONR-438-03-03.) 5 refs.

A brief survey of economic conditions and possibilities in the Lake Inari region (69° N. 28° E.). Loss of the Petsamo area and the Pasvik (Patsjoki) River valley between Lake Inari and the Norwegian border after World War II deprived Finland of access to the arctic coast, of the Kolosjoki nickel mines, and the largest power sites in northern Lapland. construction of the area devastated by the Germans is nearing completion, and severe unemployment occurred in 1954. Exploitation of lumber, the outstanding resource, is handicapped by inadequate communications, the only practical outlet being from Inari village to Porsanger Fiord on the Norwegian coast. A route along the Norwegian side of the Pasvik River, with lumber mill near Kirkenes, Northern Norway, is favored: with a ready market for lumber in northern Norway, employment for local Norwegians and the timber trucks bringing fish, other food, and fuel to Finland on Copu seen: CaMAI. return trips.

46413. LLOYD, TREVOR, 1906—. The Norwegian-Soviet boundary. A study in political geography. (Norsk geografisk tidsskrift 1956. bd. 15, 1955—56, hefte 5–6, nr. 1–2, p. 187–242, 10 illus., 9 maps, diagr.) 65 refs. including 16 maps.

Paper similar to No. 35936, with some omissions and without maps or illus.

Copy seen: DGS.

46415. LLOYD, TREVOR, 1906—. The reconstruction of North Norway, 1945–1955. Hanover, N. H., Dartmouth College, 1956. 18, 3 p. 10 text maps. Mimeographed. (Technical report ONR-438-03-04.) 3 refs.

Contains a brief survey of the physical geography and population of the Finnmark-northern Troms region, destruction of the area during World War II, needs and handicaps in reconstruction. The program is outlined: housing, transportation, mining, electric power, fishing; it is to be completed about mid-1958. Employment must be found for some 2,000 workers now engaged in the building program. The status of agriculture is still unsatisfactory due to the building

program and industrialization of fishing. Population data are appended.

Copy seen: CaMAI.

46416. LLOYD, TREVOR, 1906 .
Reconstruction of transportation in North Norway. Hanover, N. H., Dartmouth College, 1956. 27 p. 11 text maps, graphs, table. Mimeographed. (Technical report ONR 438-03-06.) 5 refs.

Contains maps and graphs with explanatory text, dealing with present and proposed land and sea routes in north Troms and Finnmark. Of primary importance is a year-round express steamer service to the larger ports, connecting with local steamers. Cargo and passenger traffic throughout the year is graphed and discussed. Surface connections provided by the main northern road from southern Norway to Kirkenes (Route 50) and by the Finnish Arctic Highway (Route 4) are relatively unimportant (except locally) as some sections cannot be kept open in winter. Road expansion since World War II has been slow; need for a good system, building policies, construction, and use: bus routes, snowmobiles, lumber routes, etc., are briefly discussed. Air services north of Tromsø (not discussed) are limited to summer and usually employ seaplanes or flying boats. Copy seen: CaMAI.

**46417.** LOBANOV, A. P. Polmennye pochvy na Dal'nem Severe. (Pochvovedenie, Dec. 1956, no. 12, p. 78-79, tables.) Text in Russian. *Title tr.:* Water-meadow soils in the far North.

Water-meadows in the river valleys of the Okhotsk Sea region are known to have the most fertile soils in the far North. Such soils of Ola District (59°35' N. 151°17' E.) are described, and results from samples analyzed by the Magadan Agricultural Laboratory are given in tabular form and discussed. Utilization of these soils for agriculture is recommended. Copy seen: DLC.

46418. LOBODANOV, N. Avtopoezdna@ vyvozka v Letskom lespromkhoze. (Lesna@ promyshlennost', Jan. 1956. god 34, no. 1, p. 17–19, diagr.) Text in Russian. *Title tr.:* Auto-sled transportation of logs from the Letsk lumber camp.

Describes the train made up of trailers on sleds connected with the pulling truck by draw chains, also by diagonal wire ropes to prevent skidding on ice or snow roads. With this arrangement skidding should not exceed 30 cm. from the center line of the road. Carrying capacity of each trailer is about 12-15 cu. m. on snow roads and 48-50 cu. m. on ice roads at a speed of 40-50 km./hr. The trailers have provision for attachment of wheels.

46420. LØCHSTØER, JENS, 1889–, Editor. Den norske leidangen. Oslo, Sjøforsvarets overkommando, 1951. 308 p. illus. Text in Norwegian. Title tr.: The Norwegian sea defense.

A thousand years' defense of the Norwegian coast is celebrated in this three-part volume. By ca. 950 A. D. the defense extended to Nordland; a tax was levied from the islands north and west of Scotland for sea defense ca. 1,000 A. D., and ca. 1543 a defense point was built at Vardø, in northeasternmost Norway.

Part one, by G. P. Harbitz, deals with sea defense by communities, its relation to land defense, its equipment and tactics, from its beginnings to the present. The second part, by S. Oppegård, is concerned with the influence of naval defense on Norway's history, with consideration of the presently controlled coast and the temporarily controlled Kola Peninsula. Part three, by Rolf Scheen, deals with fire beacons, used early to signal messages and now as navigation aids. Appended a list of fire-signal locations, several in arctic Norway.

This carnivore is found across the northern part of both eastern and western hemispheres. It is now common only in the northern districts of Finland and Norway, and sparse in the Swedish upland along the Norwegian border, and near extermination, in the country generally; it is found only where reindeer are kept and there is food supply. Records of its capture are included from 1830.

46422. LÖNNBERG, EINAR, 1865–1942. Bidrag till vargens historia i Sverige. Stockholm, 1934. 33 p., illus., table, plate. (Svenska vetenskapsakademien. Skrifter i naturskyddsärenden. 7. 26.) Refs. in text. Text in Swedish. Title tr.: Contribution to the history of the wolf in Sweden.

Includes reference to early incidence of wolves in Lapland, their ravages in connection with reindeer husbandry and the overpasturing of uplands. The northern species is recognized as the same as that found in Finland and Russia, which differs from that of southern Sweden and Norway.

Copy seen: DLC.

46423. LÖNNFORS, FRANS. Vesimääränmittaukset Suomessa vuoteen 1936. Helsinki, 1936. 65 p., tables (Finland. Hydrografinen toimisto. Tiedonantoja, no. 8.) Text in Finnish, Swedish, and German. *Title tr.:* Hydrographic measurements in Finland to 1936.

Tabulated records from several hundred observation stations, with geographic coordinates, area of drainage system and its percentage lake-covered, data on height of water and stream flow, etc. Representative figures from the arctic area are included. *Copy seen:* DGS.

46424. LÖNNFORS, FRANS. Vesimääränmittaukset Suomessa v. 1946 loppuun. Helsinki, 1948. 84 p., tables. (Finland. Hydrografinen toimisto. Tiedonantoja, no. 11.) Text in Finnish and Swedish. Summary in English. *Title tr.*: Hydrographic records in Finland to 1946.

A revised edition of the report for 1936, q. v., brought up-to-date for stations listed, but without reference to those no longer belonging to Finland.

Copy seen: DGS.

**46425.** LØNØ, ODD. Det blåser. (Polarboken, 1956, p. 161–63.) Text in Norwegian. *Title tr.:* It blows.

Describes experience of two brothers wintering on Deeve Bay, Svalbard in 1950-51, and the fierce winds which they encountered. Their difficulties in securing equipment and keeping a fire are discussed, also their sufferings from breathlessness and cold. The wind is said to be strongest on Svalbard in March and April, and northeast the prevailing direction.

Copy seen: DLC.

46426. LÖVE, ÅSKELL, and D. LÖVE. Chromosomes and taxonomy of eastern North American *Polygonum*. (Canadian journal of botany, July 1956. v. 34, no. 4, p. 501-521, 29 illus.) 78 refs.

Contains a key to the eastern North American taxa, cytological observations on the genus, and combined cytological and taxonomic studies of 25 species. The basic number of chromosomes of Polygonum s. str. is x=10. The chromosome numbers within the group range from the diploid number 2n=20 to the octoploid number 2n=80. P. fowleri, reported from Labrador and Southeast Alaska, and P. heterophyllum ssp. boreale, native to northern Canada, Greenland and northern Scandinavia, are included.

Copy seen: DLC.

46427. LÖVE, ÅSKELL. Cytotavonomical remarks on the Icelandic *Papaver*. (Nytt magasin for botanikk, 1955, v. 4, p. 5–18.) 53 refs.

Contains data on the morphology, cytology and taxonomy of this plant, a key to Icelandic and Fennoscandian taxa, followed by an annotated list of species (eight), subspecies, etc. Three of the species and three varieties are described as new; five species at least and a few varieties are native to northern Fennoscandia, Kola Peninsula, Greenland, Spitsbergen and arctic Canada.

Copy seen: DLC.

46428. LÖVE, DORIS, 1918—, and N. J. FREEDMAN. A plant collection from SW Yukon. (Botaniska notiser, July 16, 1956. v. 109, no. 2, p. 153–211, 19 illus.) 84 refs.

Area in the vicinity of the "Quill Creek camp" investigated by the authors during summer 1953, while working for the Hudson Bay Exploration and Development is described; it lies between 61°24′-61°30′ N. and 139°20′-139°35′

W., on the northeastern front of St. Elias Mts. Geographical, topographical and meteorological data are given (fig. 1-5); followed by an annotated list of 153 species of flowering plants and ferns. Five new species of Papaver are described, of which P. cornwallisensis (Cornwallis Island, Somerset Island, Boothia Isthmus and Ellesmere Island) and P. scammanianum (Fairbanks, Alaska) are outside of the investigated area. Total distribution of Cystopteris dickieana is discussed (p. 161-63, and text map).

Copy seen: DLC.

46429. LÖVKVIST, BÖRJE. The Cardamine pratensis complex: outlines of its cytogenetics and taxonomy. Uppsala, A.-B. Lundequist, 1956. 131, xvi p. 16 illus., 16 maps. (Symbolae botanicae upsalienses, v. 14, no. 2.) 102 refs.

Contains results of a combination of field studies, ecological observations, cultivation experiments, chromosome number determinations and genetical investigations, morphological examinations and taxonomic and nomenclatorial studies of C. pratensis s. latissimo. The arctic group consists of C. nymani (p. 98-105, map 3) a circumpolar species, with chromosome number 2n = 64, and 2n = 80. It seems possible that hybrid swarms exist between two different taxa in this group, but there is no definite evidence. Compatibility between members of the temperate and the arctic groups seems to be slight. The complex is divided into three groups: the repent rhizom (C. crassifolia), the arctic, and the temperate group (five species) which is very polymorphous. Copy seen: DLC.

Contains comments on work of G. de Q. Robin, (No. 42107) raising questions on heat transport in thick icecaps; also on the heating of lower layers of ice by infiltration and freezing of melt water in crevasses as possible cause of strong temperature lapses at certain stations on the Greenland inland ice. Robin's reply is appended.

Copy seen: DGS.

46432. LOEWE, FRITZ PHILIPP, 1895—. Das Klima des grönländischen Inlandeises. (Handbuch der Klimatologie, 1935. Bd. 2, Teil K, p. 67–101, diagr., tables, text map.) 61 refs. Text in German. *Title tr.:* Climate of the Greenland inland ice.

Contains general descriptions of the surface configuration of the Greenland icecap, a brief history of climatological studies with data from the Koch and Wegener Expedition 1912-13 (Borg station), the Wegener Expedition of 1930 (West station and Eismitte), and the British Arctic Air Route Expedition 1930-31 (Icecap station). Atmospheric pressure, sunshine and insolation, air temperature, humidity, fog, cloudiness, precipitation and wind are individually discussed. Theoretical considerations concerning the dynamics of icecap climatology are summarized.

LOEWE, FRITZ 46433. PHILIPP. 1895- . Über den Firnstoss im grönländischen Inlandeis. (Zeitschrift für Gletscherkunde und Glazialgeologie, 1956. Bd. 3, Heft 2, p. 253-55.) Text in German. Translated by Valda Dreimanis for Geophysics Research Directorate, Air Force Cambridge Research Center, as: Firn tremors in the inland ice of Greenland. Cambridge, Mass., American Meteorological Society, June 1956 (4. p.). Copy at CaMAI.

Contains brief description of tremors in firn observed in the winters of 1930–31 and 1950–51 and in May 1953. All tremors originated in the south and were accompanied by firn setting; one propagated to a distance of 500 km. with an estimated velocity of 300 m./sec. The hypothesis of the internal breakdown of unstable firn layers under the weight of accumulated snow is rejected since it is improbable that such layers would extend

over hundreds of km. The possibility of an earthquake as the cause of the phenomenon is considered unlikely because no earthquakes in either East or Southwest Greenland were recorded at that time.

Deals with natural conditions and the variety of forest in northern Sweden; history of the industry; integration of Norrland's river system, transport, and power development. Labor and capital are discussed, also forestry's competition with other forms of land use. Pulp production and export, processing and use of waste are described. Outline is given of the improvement of forest growth, and of working and living conditions among the lumbermen.

46441. LOPATIN, G. V. Nanosy rek SSSR; obrazovanie i perenos. Moskva. Gos. izd-vo geograficheskof lit-ry, 1952. 366 p. 47 illus., 3 maps, 107 tables (Vsesofuznoe geograficheskoe obschestsvo. Zapiski, nov. seriâ, t. 14.) Text in Russian. Title tr.: River deposits in the U. S. S. R.; formation and propulsion.

Compilation of observational data on erosion, washout and deposits of rivers in the U.S.S. R., including the northern regions. The importance of various factors is analyzed and their effects computed (equations given). Three major subjects are treated: (1) formation of deposits as affected by the volume and speed of water flow, snow cover, and slope: its length, steepness, shape, orientation, etc.; type of surface, vegetation cover, human activities, etc., are also considered. (2) Suspended material: its distribution (vertical and longitudinal), and theoretical formulation of the distribution, especially in bottom layers. (3) Composition of suspended materials, vertical, horizontal and seasonal distribution and modification of the sedimentation, movable deposits and their relation to suspended materials; flood-water deposits and causes for their formation. Maps (3) indicate degree of sedimentation in rivers, the first (p. 256) covering part of northern European Russia and western Siberia. Tabular data are given on characteristics of deposits, mobility of drifts, rate of water flow, average sedimentation, etc. Appendices offer tabular data on seasonal distribution of suspended deposits relative to annual average, and on average annual water flow and sedimentation, for all major rivers in U. S. S. R. Included are the Tsil'ma and Kem', the Ob', Yenisey, Lena systems, the Kolyma, Ayan-Yuryakh, Detrin in Siberia, and the Avacha in Kamchatka. Copy seen: DLC. 46442. 46445. LOUGHREY, ALAN G. The polar bear and its protection. (Oryx, Aug. 1956. v. 3, no. 5, p. 233-39, front.) 13 refs.

Deals with the feeding, reproduction, hibernation, migration and economic importance of Thalarctos maritimus; based chiefly on observations in northern Canada. One of the largest terrestrial carnivores, it is found in all arctic and many subarctic seas and coastal regions; its North American distribution is given. The increase in demand for polar bear skins is noted, and prohibition of their export from the Northwest Territories is recommended.

Copy seen: DA.

Contains data on the parasitism percentage (ichneumonids 72.5 percent, and tachinids 27.5 percent) of the spruce sawfly, D. polytomum, based on the study of dissected specimens collected in Pallastunturi (Kittilä, Lapland) in Aug. 1939; and notes on tachinid maggots (first and second stage) met with in the sample. This sawfly was first discovered in Canada in 1930; in 1938 heavy defoliation by it was estimated at 12,000 sq. miles in Canada and in the United States. In Canada it is practically free of insect parasites; in Europe it shows a considerably higher percentage of parasitism. Copy seen: DLC.

A biophysical study of animals progressively frozen for 40-60 minutes in baths of -5° C. Distribution of the ice in the body and organs; percentage of water converted into ice and rate of heat loss were studied. Animals with 15 percent or less of body water frozen, recovered completely; with increasing percentage of water frozen the survival rate decreased, and when 55-70 percent of body water froze, heartbeat and breathing returned but not consciousness.

Izvestifa, 1935. nov. ser. t. 19, vyp. 1, p. 121–62, illus., tables.) 28 refs. Text in Russian. Summary in English. *Title tr:* Cold resistance in the larvae of *Loxostege sticticalis* L.

An extensive study of the problem, which showed that resistance of these moth larvae (beet web-worms) to cold depends on their stage of development and the related undercooling capacity. Diapausing larvae withstood cold best and survived undercooling of  $-21^{\circ}$  C. sometimes -27° C. Repeated cooling to below  $-7^{\circ}$  C. caused freezing and death. Diapausing larvae may remain in the undercooled state for long periods, a property which enables them to hibernate, but brief sojourn at temperatures slightly above 0° destroys their undercooling capacity. The latter disappears with the diapause and larvae freeze and die at 1° to 2° C. below zero; they behave similarly also before the diapause.

46457. LÜLING, K. H. Fische, lebend eingefroren. (Orion, Nov. 1954. Jahrg. 9, no. 21-22, p. 891.) Text in German. *Title tr.:* Fishes frozen alive.

Discusses the conditions favoring the survival of naturally frozen fishes; also, experimental freezing of cold-blooded animals, including insects; hypothermia, and its use as narcotic.

Copy seen: DLC.

46458. LUENSEE, Kapitān. Meereisbeobachtungen vom Flugzeug aus. (Annalen der Hydrographie und maritimen Meteorologie, Mar. 1928. Jahrg. 56, Heft 3, p. 87–89, plate.) Text in German. Title tr.: Aerial sea ice observations.

Describes the usefulness of airplane reconnaissance on the basis of experiences along the German North Sea coast in 1927–28. The characteristics of various ice forms as seen from the air are described and illustrated (plate 11 following p. 112). Ice thickness can be determined with accuracy from a height of 100 m. Patterns in fast-ice cover can be analyzed to determine its state of growth. Drifting ice in the consolidation state can be recognized by its uneven surface. A gray, cloudy spot in the water indicates the formation of frazil ice.

46459. LUIHN, HANS. Finnmark; en økonomisk analyse. Med forord av Gunnar Bråthen. Oslo, Arbeidsdirektoratet, i kommisjon hos Tiden norsk forlag, 1952. 71 p. 9 maps, diagrs., tables. Text in Norwegian. *Title tr.:* Finnmark, an economic analysis.

Regional planning in Norway was begun in 1946 when rebuilding of devastated sections got under way. northernmost province, Finnmark, examined: natural background, communities of its five regions, population, communications, waterpower, and occupations: agriculture, reindeer raising, forestry, fishing, industry, mining, construction, trade, tourism. The labor market, financial conditions, and the peculiar problems of inner Finnmark, are discussed, with consideration of the most important proposals in the development program. Finnmark, larger than Denmark, with 15 percent of Norway's area, had only two percent of the latter's population in 1950. Population distribution is mapped (migratory Lapps specifically indicated). Ores, industrial minerals, tourist facilities, inland and offshore fishing, water power, cultivated land, and household animals are also mapped. The author, who acted as consultant to the local planning committee, is a member of the national regional planning secretariat in Oslo. His factual style of writing enables presentation of an unusual amount of information. Copy seen: DLC.

LUKASHEV, KONSTANTIN 46460. IGNAT'EVICH, 1906- . Bugroobrazovanie kak profavlenie naprfazhenil v gruntakh v svíazi s vechnoľ merzlotoľ. (Leningrad. Universitet. Uchenye za-Serifa geologo-pochvennopiski, 1936. geograficheskafa, no. 10, vyp. 3, p. 147–58, diagrs., tables.) 16 refs. Text in 58, diagrs., tables.) 16 refs. Title tr.: Mound formation Russian. as a soil-pressure phenomenon in permafrost.

Describes the formation of various mounds due to frost heaving. They are classified according to relief form: those of the far North tundras, of the forest tundras, marshes, and Eastern Siberian marshland, and those of the Far Eastern taigas; hydrostatic pressure and soil structure are considered. Most mounds are centrally depressed and cracked in various directions. The soil characteristics of permafrost are described. Relationships between soil structure, particlesize distribution, water content, density and depth, as well as between the loadcarrying capacity and water content are tabulated.—From SIPRE.

46461. LUKASHEV, KONSTANTIN IGNAT'EVICH, 1906- . O granulometricheskom sostave gruntov oblasti rasprostraneniâ vechnol merzloty. (Leningrad. Universitet. Uchenye zapiski, 1937. serifa geologo-pochvenno-geograficheskafa, no. 16, vyp. 4 (t. 3), p. 170-84, tables.) 41 refs. Text in Russian. Title tr.: Granulometric composition of

soils in permafrost regions.

The granular characteristics of soils in the permafrost regions of the U. S. S. R. are presented. Data on grain size are tabulated for a representative selection of soil types from areas of permafrost, among them Vorkuta, Igarka and other lower Yenisey and tundra localities. The granular composition of any particular soil in an area of permafrost is the result of a particular combination of mechanical, chemical and biological factors. Chemical and biological factors are important only in the thin active layer. Soils of volcanic origin are subject to the most rapid disintegration.—From SIPRE. Copy seen: DLC.

46462. LUKASHEV, KONSTANTIN IGNAT'EVICH, 1906— . Opolzanie i oplyvanie gruntov v usloviňákh vechnot merzloty. (Leningrad. Universitet. Uchenye zapiski, 1938. seriía geologopochvennykh nauk, no. 26, vyp. 6, p. 6–22, illus., diagrs.) 22 refs. Text in Russian. Title tr.: Soil creep and flow in permafrost.

Contains description of various types of soil creep and flow observed on the slopes, hills, river banks, railroad embankments and other construction works, with photo-illus. Causes of the movements are analyzed for three types of soil. The creep and flow are explained by the unfavorable granularmetric composition of the soil, excessive moisture, and unstable thermal conditions. The ground may also be affected by physico-mechanical processes such as thickness of frozen ground, flexibility of soil between the frozen and thawed condition, by loads, ground slope, etc. Copy seen: DLC.

46463. LUKENBERG, T. S. Iz opyta ėkspluatafsii betonomasosov na stroiteľstve Gor'kovskogo gidrouzla. (Mekhanizafsifa stroiteľstva, Sept. 1956. god 13, no. 9, p. 9–13, illus., diagrs.) Text in Russian. Title tr.: Experience in the use of concrete pumps in construction of the Gor'kiľ dam.

A special installation for continuous pouring of concrete mass in large-scale construction is described in detail. The installation consists of concrete mixers, a large pump, and a set of pipes (in easily disassembled sections) to the pouring site. During the winter period, the mixers and pump are kept in heated sheds and they are supplied with hot water. The temperature of the concrete in the well-insulated pipes is maintained at about 30° C. During severely cold weather, the concrete is poured into special buckets placed in an electrically heated railroad car, and rolled to the site. Pump and pipes are cleaned regularly with boiling water and a special wad of canvas pushed through the pipes by compressed air. The cost per cu. m. of operating with this set-up is slightly higher than that with tower or derrick cranes, but the delivery of concrete is faster. Copy seen: DLC.

46472. LUND, KAJ BUDDE. Nogle problemer vedrørende fri handel i Grønland. (Grønland, Jan. 1956, nr. 1, p. 1–12, illus.) Text in Danish. *Title tr.*: Some problems concerning free trade in Greenland.

Discusses free trade versus monopoly: the monopoly law of 1925 is still valid, but trading licenses are given to an increasing number of private individuals. The latter offer great competition, mainly in luxury goods; while the monopolistic Greenland Trading Company keeps prices down on utility goods for social reasons. In consequence, the Company faces a deficit due to low profits and extended supply line to small settlements; private trade faces rising prices, installment buying is a possibility, etc. Restriction in granting licenses is suggested; also introduction of income tax; the question is raised whether the Company ought not to abandon its welfare policy.

46480. LUND-DROSVAD, ANDR. Hvidfiskefangsten ved Prøven. København, Ejnar Munksgaard, 1952. 51 p. 6 illus. by Gitz-Johansen. Text in Danish. *Title tr.*: The catching of small whales at Prøven.

In Greenland, soon after Hans Egede's colonization and the decrease in great whales, the lesser sea mammals came into greater use and new means of capture, other than kayak chase in the open sea, became necessary. Small enclosures of coastal waters, were "fenced" with nets, and passing herds of small whales were driven into such corrals. Qaquq, near Godthaab, and Agpamiut, south of Evighedsfjorden, were well suited to this type of catch. Methods of chase at Prøven in the Upernavik district are described and the annual catch during 1925-1950 is given. The effects are noted of change in time and routes of migrations

of whales and cod. A typical catch is described in detail (p. 24-51).

46489. LUNDQVIST, GÖSTA, 1894— Blocksänkor och några andra frostfenomen. (Geologiska föreningen, Stockholm. Förhandlingar, 1951. bd. 73, häfte 3, no. 466, p. 505–512, illus., textmap, diagrs.) 12 refs. Text in Swedish. Summary in English. Title tr.: Boulderfilled depressions and some other frost phenomena.

Boulder depressions, common in Sweden, appear each to be filled with boulders of uniform size. The boulders are actually of gradually decreasing size in subsurface layers and at the bottom is fine impervious soil. It is believed that frost action has

gradually sorted them by ice heaving of the larger members. Various earlier interpretations of such phenomena require re-examination, as their origin in some other manner may have been used as a basis for farther-reaching scientific conclusions. The map of these depressions in Sweden, includes sites in the arctic region.

Records from 102 Finnish weather stations, including those in Lappmark, were analyzed to determine effective temperatures of degree days; maps with 5° C. and 10° C. isolines are shown, and comparison is made with northern limits of 11 forest species. Numbers of days above these temperatures and the total degree days are tabulated for the northern limits of eight of these trees. Finally, temperature, direct sunlight, wind, and precipitation are noted in their effects on effective temperatures, and Finland is divided into 22 climatic sections (map) for purposes of plant, animal, and human regional studies. The exact figures used in compilation of this map are not given. but comparisons are made with the similar work of other investigators.

46497. LUSHBAUGH, CLARENCE CHANCELUM, 1916—, and others. The production of poikilothermia in mice by oxazole quaternary salts. (Journal of pharmacology & experimental therapeutics, Mar. 1956. v. 116, no. 3, p. 366–75, illus. table) 5 refs. Other authors: F. N. Hayes, W. H. Langham, D. G. Ott, and P. Sanders.

Out of 17 oxazolium tosylates synthesized and tested, two stood out as potent inhibitors of thermoregulation in mice: 2-(4-methoxyphenyl)-3-methyl-5-phenyloxazolium tosylate and 2-(1-naphthyl)-3-methyl-5-phenyloxazolium tosylate. The duration and extent of the induced poikilothermic state were directly proportional to the dose, the body temperature being determined by the ambient temperature. It is assumed from in-

direct evidence that the compounds act directly upon the central nervous system.

46498. LUTZ, HAROLD JOHN, 1900 Damage to paper birch by red squirrels in Alaska. (Journal of forestry, Jan. 1956. v. 54, no. 1, p. 31–33, 3 illus.) 5 refs.

Horizontal girdling of paper birches was observed on Turnagain Arm, Cook Inlet, in June 1952, also near Anchorage, in summer 1954 when stems were collected for study. Nature of the injury is described; teeth marks indicate the red squirrel (Tamiasciurus hudsonicus Erxleben) as cause. This squirrel population varies with occurrence of heavy seed years in spruce (last peak year 1951). Injuries to birch appear to coincide with low seed years when squirrels must resort to other food sources. In one area near Anchorage with an average of 1.625 paper birches per acre, 1,235 (76 percent) were injured or dead. Copy seen: DGS.

46499. LUTZ, HAROLD JOHN, 1900— . Ecological effects of forest fires in the interior of Alaska. Juneau, Oct. 1953. 36 p. 10 illus., text map, tables. (U. S. Forest Service. Alaska Forest Research Center. Station paper, no. 1.)

Summary of No. 46500, a study conducted by the writer from Kenai Peninsula north through the Matanuska, Copper and Tanana River valleys, also west of Wiseman in northern Koyukuk River basin. Geography, climate, forests and history of forest fires are noted. Effect of fires on white and black spruce, paper birch, quaking aspen, and tacamahac poplar is stated; forest succession following fires, effect of fires on soil, hydrological relations, animal populations, and future economic development are dealt with. Copy seen: DGS.

46500. LUTZ, HAROLD JOHN,
1900- . Ecological effects of forest
fires in the interior of Alaska. Washington, D. C., U. S. Govt. Print. Off.,
Mar. 1956. 121 p. illus., text map,
graph, 26 tables. (U. S. Dept. of

Agriculture. Technical bulletin, no. 1133.) 165 refs.

Contains results of investigations during 1949-1952 from Kenai Peninsula north to the Yukon River (primarily along the Glenn, Richardson, Alaska, and Steese Highways), including almost all the area within the commercial range of white spruce. Species composition, size and age relations, density of cover, and successional trends in plant communities were studied (sample plots). Alaskan forests are described and fires reviewed historically. Their effect is discussed with respect to white and black spruce, paper birch, quaking aspen, balsam poplar, shrubs, herbaceous plants, mosses, and lichens. Post-fire succession of plant communities is described in some detail, with lists of trees, shrubs, grasses, forbs, mosses, and lichens in each successiontype. Effect of fire on soils, on hydrological relations, on fur-bearing animals, moose, caribou, and on economic development is also dealt with.

46501. LUTZ, HAROLD JOHN, 1900 - Effects of fire on soils in northern forests. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 54–55.)

Forest fires partially or wholly remove humus layer resting on the mineral soil body. Soil acidity is reduced, and availability of nitrogen, phosphorus, potassium, and calcium tends to increase. Surface temperatures are higher, and permafrost table moves downward. Thermokarst may result when ice lenses melt. Runoff from steep slopes increases, but erosion is small due to low precipitation, low intensity of rainfall, long frozen period, and rapid re-vegetation.

46502. LYMAN, CHARLES PEIRSON, 1912—, and P. O. CHATFIELD. Physiology of hibernation in mammals. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia . . . symposium, Oct. 1955, pub. 1956. p. 80–124, illus., tables.) 170 refs.

A comprehensive study and discussion of "deep hibernation," a form of this condition accompanied by "a profound drop in body temperature with a concurrent decrease in metabolism and heart rate." The material is arranged in chronological order, from preparation for, to arousal from, hibernation, and covers problems of fat and food storage; the brown fat; endrocrines; temperature, circulation, metabolism and body chemistry, nervous system and blood during hibernation; growth; conditions during arousal, especially circulation and the cardiovascular system in general; heat production, metabolism, nervous and other activities during awakening. Two general chapters on physiological specializations and theories of hibernation conclude the account. Copy seen: DLC.

46503. LYNCH, WILLIAM FRANCIS, 1905— . The effects of moderately low temperatures on the rate of metamorphosis of *Bugula flabellata*. (Physiological zoology, July 1956. v. 29, no. 3, p. 212–26, tables.) 49 refs.

Temperatures of  $+1^{\circ}$  to  $-5^{\circ}$  C. caused ejection of holdfasts by the larvae of these bryozoans. The second stage of metamorphosis, the migration of ciliated epithelium to the basal region is retarded by temperatures of  $0^{\circ}$  and below. Gradual lowering of temperature to  $0^{\circ}$  C. was seemingly less effective in evoking precocious metamorphosis than sudden immersion in cold water.

46513. McALLISTER, RAYMOND FRANCIS, 1923- . Unusual debriscovered ice cones from Umnak Island. (Journal of glaciology, Mar. 1956. v. 2, no. 19, p. 631-32, 2 illus.) 4 refs.

Contains description and illus. of small volcano-shaped ice cones observed on a glacier on this Aleutian Island (53°11' N. 168°25' W.) under an ash blanket 10-13 cm. deep during the summer of 1948. The cones varied in basal diam. from 50 to 125 cm. with a max. height of 62 cm. The craters studied ranged from 2 to 16 cm. across the top and from 1.3 to 77 cm. and more in depth. The cones probably postdate the ash fall. In discussion following the text (p. 632) W. V. Lewis suggests that the cones resulted from retarded ablation of ice surrounding ashfilled pockets. These pockets may have resulted from drifting hot ash collecting in a previously pitted surface.-from SIPRE.Copy seen: DLC.

Deals with absorption of features of Christianity by shamans among the Tutchone, Tagish, Taku, Athabascan and Tlingit-speaking bands, on the upper Yukon, Pelly, Alsek River area, a population of some 700 in all. The shaman's "call" and training, his technique in precontact (with whites) times are described. Since the advent of Catholic and Protestant missions, he has incorporated a few Christian symbols and practices into the traditional beliefs and performances, and "though crucial parts of Christianity and shamanism overlap at scarcely any point," he continues to satisfy both pagan and Christian natives. This "patterned adaptability," can be discerned in other facets of native life.

A study of the soil microfauna (arthropods and nematodes) of which 163 were found new to the Island and 18 new to science. The subject is treated under the aspect of ecological communities and their distribution, general distribution, frequency of forms in time, etc. Over a dozen species of additional invertebrates are also listed. The material was collected by the author during the Oxford

University Expedition to Jan Mayen in 1947. Copy seen: DA.

46526. MACFARLANE, IVAN C. Techniques of road construction over organic terrain. (In: National Research Council of Canada. Associate Committee on Soil and Snow Mechanics. Proceedings of the Eastern Muskeg Research Meeting, February 22, 1956. Ottawa, Oct. 1956. Technical memorandum, no. 42, p. 2–15, cross-sections.) 4 refs.

A review of methods used by various countries and organizations. Muskeg is usually unstable under application of load. Failure may occur by lateral flow (or shear) and by compression (excessive settlement). Three main ways of road construction are: (1) floating the road on the muskeg; (2) removing the unstable material and replacing it with fill; (3) supporting the road on piles. Each method is discussed; also the stabilization of muskeg by sand drains and by chemical means.

46530. McGLYNN, J. C. The Northwest Territories, a prospecting paradise. (Canadian mining journal, Apr. 1956. v. 77, no. 4, p. 60-62, text map.)

Contains a survey of mineral possibilities in Keewatin and Mackenzie Districts, based on information from recent prospecting activity and geologic mapping. General geology and structure of area are summarized; metals (gold, uranium, copper, lead and zinc, nickel, lithium) are discussed with information on geology and mineralization of the deposits and on favorable prospecting areas.

Copy seen: DGS.

46531. McGOUGH, RAYMOND J. Local environmental factors affecting ice formation in North Star Bugt, Greenland. Washington, U. S. Navy Hydrographic Office, Jan. 1956. vi, 40 p. diagrs., tables, text maps. (Its: Technical report TR-23.) 4 refs.

Contains analysis of meteorological and oceanographic influences on local ice conditions in relation to ice forecasting. Results of detailed ice-growth studies in the fall of 1953 are given. Free water exchange with the fiord at all levels and the negligible fresh-water runoff and annual change in surface water temperature during the open season make North Star Bugt a suitable area for long-range ice prediction techniques based on the thermohaline structure. Observed and computed ice thicknesses were nearly identical, both for the original ice and new ice which formed after the ice was broken up by wind action. Tabulated and graphed data include: mean air and water temperatures; synoptic weather observations; monthly snowfall for 1946-1949; water temperature, salinity, and density profiles; temperature and salinity gradients in ice; ice growth as a function of degree-days of frost in 1948-49 and 1953; and computed and observed ice growth curves. McGRATH, HELEN, see Hegsted, D. M., and others. Effect . . . low temperature . . . magnesium requirement. 1956, No. 45490.

46532. MACHATSCHEK, FRITZ, 1876—. Geomorphologie. 5., verb. und erweiterte Aufl. Leipzig, B. G. Teubner, 1952. 203 p. illus., maps. Text in German. *Title tr.:* Geomorphology. 5th rev. and enl. ed.

Includes (in chap. 7, p. 120-40),

account of the glacial forms, land ice, which as glacier, inland icecap, etc., leave morainal material and sculptured forms as evidence of ice movement. Ice action is distinguished on the basis of locational differences, in relation of morainal material to bedrock origin, or by combinations of ice and meltwater deposits, polishing, and stoss and lee forms related to direction of movement. Final glacial-stage landscapes are found on the Fennoscandian and Labrador shields, selective erosion in folded mountains, gouging and damming in lake formations. In chap. 9 (p. 161-72) on climatic morphology, the role of climate in geomorphic development, is discussed in connection with the main world climate patterns, among them the Arctic. In chap. 10 (p. 173-95) on coastal forms and islands, consideration is given to the littoral zone and coastal form developments, distinctions, and classification; the nature of coasts in high latitudes or glaciated sections of lower latitudes is discussed. Copy seen: DLC.

46533. McILWRAITH, THOMAS FOR-SYTH, 1899 - Bibliography of Canadian anthropology for 1954. (Canada. National Museum. Bulletin, 1956. No. 142, Annual report 1954-55, p. 166-80.)

Annual survey of publications formerly published in the Canadian historical review (file in DLC). It was prepared during 1925–1954 by Dr. McIlwraith, and in early years by Diamond Jenness (mostly). The survey prepared in 1955, covering publications of 1954 or late 1953, contains 168 references with brief annotations (10 to 50 words), many of them dealing with the Eskimos and on Indians of subarctic Canada.

Copy seen: DGS.

46534. McINTYRE, A. D., and J. H. STEELE. Hydro-biological conditions in the Denmark Strait, May 1954. (International Council for the Exploration of the Sea. Annales biologiques, 1954, pub. 1956. v. 11, p. 20-25, illus., maps.)

Account of investigation carried out in connection with halibut fisheries, on temperatures, salinities and ice limits off Greenland. Currents were determined with the aid of dynamic calculations and samples for chlorophyl and phosphate determinations taken at all stations; dry weight of plankton was determined and the water examined for halibut eggs and larvae.

McKAY, IAN A., see Drummond, R. N., and others. Investigations . . . boreal forest of Labrador-Ungava. 1956. No. 44662.

46535. MACKAY, JOHN ROSS, 1915—. Deformation by glacier-ice at Nicholson Peninsula, N. W. T., Canada. (Arctic, 1956. v. 9, no. 4, p. 219–28, illus. 2 text maps, profile.) 14 refs.

Two excellent examples of sediments deformed by glacier ice occur on Nicholson Peninsula, Mackenzie District (Liverpool Bay, 69°54' N. 129° W.). ments, topography and structure of the Peninsula are described. Altitudes in the hilly northern half attain 200-300 ft. above sea level, whereas those in the south rarely exceed 30 ft. The hills were formed either by glacier ice moved against a topographic obstruction, resulting in a large push moraine, or by the drag effect of ice moving over weak strata. Deformation could have occurred during the last ice advance or earlier, probably in a single period of deformation, but whether the ground was frozen at the time is not evident. Copy seen: DLC.

46536. MACKAY, JOHN ROSS, 1915—. Mackenzie deltas, a progress report. (Canadian geographer, 1956. no. 7, p. 1–12, 4 text maps, graphs, cross-sections.) 22 refs.

The Mackenzie is the descendant of older rivers that flowed into the Beaufort Sea during interglacial stages of the Pleistocene. These rivers can be recognized by remnants of channels and The modern postdeltaic deposits. glacial delta is sharply delimited by the Richardson Mts. on the west, the Caribou Hills on the east, and by older deltaic or fluvial deposits on the northeast (Richards Island - Tuk Peninsula). Physiography of the ancient-modern delta area is described. Size, shape, and number of lakes vary from south to north. The older terrain differs from the modern in altitude, relative relief, presence of pingos and of oriented lakes (similar to those on the north coast of Alaska).

Copy seen: DLC.

46537. MACKAY, JOHN ROSS, 1915—. Notes on oriented lakes of the Liverpool Bay area., Northwest Territories. (Revue canadienne de géographie, Oct.—Dec. 1956. v. 10, no. 4, p. 169-73, 2 illus., 2 text maps.) 7 refs. Summary in French.

In this area (70° N. 129° W.) of Mackenzie District, oriented lakes similar to

those at Pt. Barrow, Alaska, and Old Crow, Yukon, are found in two types. The large lakes are one to two mi. long and one-half to one mi. wide; the small ones occur in groups of five to 50, on average 150 ft. long and 75 ft. wide. Long axes trend north-south, at right angles to prevailing winds as at Pt. Barrow and Old Crow. Writer considers that the cross-wind theory of lake orientation discussed by Livingstone (No. 41089) probably applies in all three areas; that these lakes are being formed by processes now operative. He rejects the Pleistocene wind hypothesis and others. Copy seen: DGS.

46538. MACKAY, JOHN ROSS, 1915—. Oriented lakes of the Liverpool Bay area, N. W. T., Canada. (Association of American Geographers. Annals, June 1956. v. 46, no. 2, p. 261.)

Abstract of paper presented at the 52nd Annual Meeting of the Association, Montreal, Apr. 1–5, 1956. North-south oriented lakes of this area lie in sand and silt, usually within 50 ft. of sea level. Two types exist: large lakes shrinking in size through infilling by polygonal ground; and small lakes increasing in size through coalescence and elongation of ponds developed on polygonal ground. Strong prevailing winds blow across the lakes, Comparisons are made with similar lakes at Pt. Barrow, Alaska, and with the "Carolina bays." Copy seen: DGS.

46539. MACKAY, JOHN ROSS, 1915-, and W. H. MATHEWS. Superficial geology of the Firth River archaeological site, Yukon Territory. (Arctic, 1956. v. 9, no. 3, p. 210-11.)

Authors spent Aug. 18-Sept. 3, 1956, at and near this northern Yukon site being excavated by Dr. R. S. MacNeish, q. v. Geomorphic and stratigraphic problems were studied. Factors hindering stratigraphic interpretation are noted. Relationship of the stratigraphic succession to a late glacial advance along the arctic coastal plain was determined. Further study of clay specimens will be made, also Carbon 14 datings from Dr. MacNeish's specimens.

Copy seen: DLC.

46540. McKENZIE, RUSSELL ALDER-SON, 1902— Arctic or polar cod, Boreogadus saida, in Miramichi Bay, New Brunswick. (Copeia, Nov. 27, 1953, no. 4, p. 238–39, table.)

Contains distributional data and a table

of measurements of this circumpolar species, abundant in arctic seas of Asia and North America. It is commonly found in Hudson Bay and around Greenland. The extension of range is apparently due to the very mild winters of 1950-51.

\*\*Copy seen: DLC.\*\*

46541. MACKENZIE, W. J. Aerial radioactivity prospecting. (Mining magazine, May 1956. v. 94, no. 5, p. 261-63, illus.) 2 refs.

Reviews the advantages of helicopters over fixed-wing aircraft for prospecting in northern Canada. The latter cannot fly safely close to the ground, and are costly beyond results obtained. Detection of anomalies by helicopter in northern Saskatchewan and Northwest Territories is noted. The Bell type with "full view cockpit" for general purpose aerial prospecting is recommended.

Copy seen: DGS.

46542. McKerrow, C. A. Some recent measurements of atmospheric noise in Canada. Boulder, Col. [1956] 10 p. diagrs. (*In:* U. S. National Bureau of Standards. Symposium on the propagation of V. L. F. radio waves, Jan. 23–25, 1957, paper no. 12.) 7 refs. Prepublication record.

The root-mean-square atmospheric noise amplitude on a frequency of 10 kc. was measured at Ottawa over a period of one year beginning in Oct. 1955, and at Churchill on a frequency of 107 kc. for the period from Dec. 1955-Aug. 1956. A graphical analysis showing the hourly median variations is presented, and the results are compared with earlier data obtained in Canada and estimated values of the U.S. National Bureau of Stand-Systematic daily and seasonal variations occur at both stations with an increase in the noise level during the winter. Copy seen: DLC.

McKINLEY, ASHLEY C., 1896—, see U. S. Office of Naval Operations. The dynamic North. 1956. No. 48636.

46543. MACKWORTH, N. H. Local cold acclimatization in man. (Polar record, Jan. 1956. v. 8, no. 52, p. 13–21, illus.) 9 refs.

Contains account of investigation on impairment of sensation by cold, made

by the tactile two-point discrimination method and the vibration threshold methods. Experiments were carried out at Fort Churchill and under cold room conditions in England. Both sets of experiments indicate considerably less tendency to numbness in cold-acclimatized persons.

\*\*Copy seen: DLC.\*\*

46544. McLAREN, I.A. The biology of the ringed seal (*Phoca hispida* Schreber) in the waters of southwest Baffin Island. Montreal, McGill University [1956?] vii, 142 l. illus., diagrs., graphs, maps, tables, 50 refs. MS thesis, McGill University.

Account of investigation based on material collected or procured in 1953 (as part of the Calanus Expedition) and in 1954; information gathered from the Eskimos, is also included. The following problems were studied; age, by dentinal annuli and other methods; food of inshore and offshore seals; feeding seasons; body condition and dentine deposition; reproductive age in male and female; sexual cycle; breeding season; implantation and early growth of embryo; birth lair; the young; ecology of the reproduction area; movements, dispersal; population samples; factors determining distribution in the Canadian Arctic. Appendices present, in tabular form, data on feeding, body measurements, and reproduction.

Copy seen: CaMM.

MACLEOD, E. G., see Bickley, W. E., and E. G. MacLeod. A synopsis . . . Chrysopidae . . . 1956. No. 44021.

46545. McLOUGHLIN, JOHN, 1784–1857. The financial papers of Dr. John McLoughlin, being the record of his estate and of his proprietory accounts with the North West Company (1811–1821) and the Hudson's Bay Company (1821–1868) edited by Burt Brown Barker. Portland, Oregon Historical Society, 1949. 87 p. fold. facsims.

Reprinted from the Oregon historical quarterly, Mar., Sept. 1944, and Sept. 1949.

Documents are presented in detail and McLoughlin's career briefly reviewed to establish that allegations of unfair treatment from the Hudson's Bay Co. are unfounded in fact. McLoughlin, a physician, engaged in the fur trade with the Northwest Co. from 1803, till its union with Hudson's Bay Co. in 1821, then with the latter as its chief factor till 1845.

Copy seen: DLC.

46546. McMILLAN, I. K. R., and others. Hypothermia; some observations on blood gas and electrolyte changes during surface cooling. (London. Royal College of Surgeons of England. Annals, 1955. v. 16, no. 3, p. 186-94, illus.) 14 refs. Other authors: D. G. Melrose and R. B. Lynn.

Contains account of investigation on dogs aimed at ascertaining the role of blood CO<sub>2</sub> and electrolytes in the etiology of ventricular fibrillation during hypothermia. No surgical procedure was performed and no cardiac drugs were used. No correspondence between CO<sub>2</sub>, pH, and electrolyte changes was observed; none of these changes offered an explanation of the onset of ventricular fibrillation in hypothermia.

46547. McMURRAY, WILLIAM M. Data collection for the Northern Hemisphere map series. (U.S. Weather Bureau. Monthly weather review, June 1956. v. 84, no. 6, p. 219-34, 16 text maps, graph.) 4 refs.

Contains historical background of the Daily series, synoptic weather maps, Northern Hemisphere, sea-level and 500millibar charts, with synoptic data tabulations, with emphasis on the current series (July 1955, on). Maps include Canada, Alaska, Greenland, Scandinavia and Finland, Svalbard, and U. S. S. R. Methods of data collection are described: North Hemisphere stations and their types of reports are mapped. Improvement in number of stations plotted since 1953, and the effect on historical weather analysis is noted: greatest additional data have come from Greenland, northernmost and west-central U.S.S.R. Copy seen: DGS.

46548. McMURREY, JAMES D., and others. Studies on hypothermia in monkeys, 1; the effect of hypothermia on the prolongation of permissible time of total occlusion of the afferent circulation of the brain. (Surgery, gynecology & obstetries, Jan. 1956. v. 102, no. 1, p. 75–86, illus. tables.) 9 refs. Other authors: W. F. Bernhard, J. A. Taren and E. A. Bering, Jr.

Contains a study of the maximum time for safe vascular occlusion during hypothermia. A single 15-minute period with hypothermia of 26°-23° degrees was well tolerated, but not one at 22° C. Multiple 12-min. occlusion periods were tolerated if adequate time for recovery was allowed

between occlusions. Data on EEG changes, and follow-up electroencephalograms are also presented and discussed. Copy seen: DLC.

46550. MACNEISH, RICHARD STOCK-TON, 1918- . Archaeological reconnaissance of the delta of the Mackenzie River and Yukon coast. (Canada. National Museum. Bulletin, 1956. 142, p. 46-81, 6 plates, text map, diagrs.,

table.) 15 refs.

Contains results of investigations in summer 1954. Author's itinerary is outlined, sites found (30) are located and briefly described; also the collected specimens and five types of houses. At least three major cultural complexes appear to be represented in this area: the earliest, site NiVk 1, at Engigsteiak on Firth River, tentatively classified as a component of the Cape Denbigh (Flint Complex or) Phase, the latest, Thule Eskimo, found at many sites. The first complex holds possibility for further information on the Cape Denbigh complex, its possible

ancestral relation to early Eskimo and Dorset, and on the movement of peoples into this area. In a paper summarizing 1955 work at Engigsteiak (No. 46551) author describes two older stages (British Mountain and Flint Creek) at this site. Copy seen: DGS.

46551. MACNEISH, RICHARD STOCK-TON, 1918- . The Engigsteiak site on the Yukon arctic coast. (Alaska. University. Anthropological papers, May 1956. v. 4, no. 2, p. 91-111, illus., table, sketch map.) 20 refs.

Contains a preliminary progress report on the 1955 excavations conducted by the National Museum of Canada at the foot of the British Mountains along the east bank of the Firth River. The finds are described, a tentative sequence of nine culture complexes is established and a comparison with other arctic sites is attempted. Copy seen: DLC.

46552. MACNEISH, RICHARD STOCK-TON, 1918- . Prehistoric invasion. (Beaver, Summer 1956. Outfit 287, p. 46-48, illus., sketch map.)

Popular account of search by National Museum of Canada parties for evidence of early migrations from northeast Asia. In 1954, a four-man party led by the writer discovered a site on Firth River, northern Yukon, and in summer 1955 nine weeks were spent in excavation. Nine different cultures were found, the oldest of which may be as old as any complex found in the New World. The three earliest are represented by stone tools, the next three contained pottery, similar to that found in eastern Canada and northeast Siberia. The three most recent complexes contain prehistoric Eskimo tools and pottery, the oldest

dating from about 2,000 yrs. ago. Copy seen: DLC.

Notes marked physiographic contrast between regular coast line of the southern slope of Mt. St. Elias, and the deeply fiorded coast of Southeast Alaska and Prince William Sound regions. physiographic evidence indicates that the studied region has not passed through the same episodes of Quaternary development as the remainder of the Pacific continental shores of Alaska. The whole terrain has been uplifted and deformed. Copy seen: DLC.

46557. MAGNUSSON, ADOLF HUGO. 1885- . A monograph of the genus Acarospora. Stockholm, Almqvist & Wiksell, 1929. 400 p. 18 text maps. (K. svenska vetenskapsakademien.

lingar, ser. 3, bd. 7, no. 4.)

Basic work on this crustaceous lichen genus, with (p. 10-44) data on systematics, morphology, anatomy, chemical reaction, ecology and distribution. In the descriptive part (p. 45-378) is a systematic list of 199 species, and another list of dubious and excluded species. Synonyms, keys, Latin diagnoses, English descriptions, critical notes, also data on habitat and distribution are supplied. Some 70 species and varieties, and many forms are described as new. A number of the species are circumpolar in the Northern Hemisphere. The single arctic circumpolar species is Molybdina (p. 349-53, map 1), eleven others are boreal circumpolar species. A supplement (the first), pub. 1930, includes no arctic material. Copy seen: DLC.

Trudy, 1956, vyp. 5, Material vtorogo ugol'nogo geologicheskogo soveshchanifa, p. 238–48.) 6 refs. Text in Russian. Title tr.: Paragenesis of coals, wall rocks and concretions of the Vorkuta series and methods of forecasting the coalbearing capacity.

The 1300-2700 m. thick Vorkuta coalbearing series contains lower, middle and upper sub-series, 200-800 m. each, which break up into 30-200 m. "packets" and 8-30 m. cycles. From lithological study begun in 1941, 47 types of rocks and over 110 types of concretions have been found. A cycle usually contains the following stratigraphic elements or zones: coal; near-coal argillites; basin argillite poor in flora remains and concretions; interbedded siltstone; sandstone with sandankerite concretions. The succession of these strata, their interrelation and significance as coal-seam indicators are discussed. Copy seen: DLC. MAKINEN, YRJÖ, see Laine, U., and others. Moskva, Izd-vo Akademii nauk SSSR, 1955. 182 p. 161 illus., incl. plans, sketch map. 35 refs. Text in Russian. Title tr.: Monuments of folk architecture in the Russian North. From materials of the Complex Expedition by the History of Arts Institute of the Academy of Sciences U. S. S. R. and the State Historical Museum.

Preliminary results of investigations in the Mezenskiy, Verkhne-Toemskiy, Yarenskiy and Kargopol'skiy Districts of of Arkhangel'skaya Oblast' and the Zaonezhskiy and Kemskiy Districts of Karelo-Finnish SSR. They represent the third (1952-1953) party's work in a program, initiated by the Institute in 1950, for study and preservation of historical monuments. In a veritable census of olden structures: one- and multi-roomed cottages and one- and two-storied houses, windmills, bath-houses, churches, etc., the architectural styles of 17th to 20th century, decorative wood carvings, floor plans, etc., are described with measurements and illus. Specific problems and regional architectural trends are discussed, e. g. grain storage-houses on piles, elevated platforms for drying of fire-wood, and retaining walls along the Mezen' River known for its spring floods; openwork wood carvings on house fronts and interiors in the Verkhne-Toemskiy District; column-supported porches of dwellings and granaries in the Kargopol'skiy District; "dove-cote" funeral monuments in the Kemskiy District, The timber used in these log and frame buildings (spruce, pine, larch, etc.) is noted, and the northern styles compared with Russian rural architecture of other regions. Studies of the "polar tide" phenomenon are reviewed on the basis of observational data on 14-month nutational fluctuation Atlantic, Indian and Pacific Oceans. The latitudinal variations of the "polar tide" amplitudes and their vectoral diagrams are analyzed for the North Atlantic in seven-year periods, 1922–1943. Separate and average mean values of the "polar tide" for cotidal months are tabulated (p. 21); a cotidal diagram of the "polar tide" is shown (p. 27) for the Arctic Ocean; the lines for equal nutational anomalies of mean ocean levels for five- and twelve-month periods are shown (p. 28–29). Mean values of periods (years) and relative amplitudes of the periodical nutational fluctuation of general glaciation in different arctic regions are given (map p. 31); annual and 14-month amplitudes in temperature variation in Iceland and Greenland water are tabulated (p. 32). In conclusion a free oscillation of the instantaneous axis of the earth's rotation is discussed in relation to the circumpolar stationary wave of the "polar tide" in the ocean, their meridional and zonal assymetry, variation in ocean water circulation, appearance of nutational fluctuation of glaciation of polar seas and other long term phenomena.

Text in Russian. *Title tr.*: Experience in the use of slag concrete in assembled construction.

Deals with composition, manufacturing processes and assemblying of light-weight concrete blocks and wall panels for use in exterior and interior walls, partitions, face decoration, etc., in industrial and residential buildings. The concrete mixture is prepared with furnace slag in various proportions for heat conservation and frost resistance (p. 54). Technological processes are described for mass-production: chemical composition, me-

chanical and thermal properties, arrangement of processes on the production line, including mixing of masses, casting, drying (with steam or electric heating), storing, transportation, etc. The light-weight frost-resistant concretes include the "slag-gas-concrete" with gas- and heat-forming additives, viz.: calcium chloride, sodium chloride, aluminum powder, (p. 130-33). Shapes and sizes of the blocks or slabs vary from small bricks to prefabricated wall panels with doors, windows, decorative facings and steamheating piping cast within the panels (p. 137-58). Construction details are specified for various degrees of sound resistance (tables 27-28), and for various localities from Baku to Yakutsk, with air temperature range of  $-10^{\circ}$  to  $-50^{\circ}$  C. 46575. MALAURIE, JEAN NOËL. L'activité géographique française dans les régions polaires, 1940–1955. (In: La Géographie française au milieu du XX° siècle. Paris, J. B. Baillière, 1956. p. 261–80.) Text in French. Title tr.: French geographic activity in the polar regions, 1940–1955.

A survey of French publications on the Arctic and Antarctic, with accompanying notes on field work. Publications of 1940-1947 in physical geography, ethnography and bibliography are listed, followed by those of 1947-1955: results from P.-É. Victor's Expéditions polaires françaises to Greenland (cartographic work, seismic and gravimetric studies, glaciological measurements, meteorological work, studies in physical geography on the west coast), the writer's Mission géographique

française à Thule (1950-1951), work in Canada and Svalbard. Note on polar techniques is added. **Copy seen:** DLC.

46576. MALAURIE, JEAN NOËL. The French Geographical Expedition to Thule, 1950–1951: a preliminary report. (Arctic, 1955, pub. 1956. v. 8, no. 4, p. 202–214, 4 illus., text map, graphs.) 23 refs.

Summarized results of author's expedition to northwest Greenland, July 1950-July 1951. With base at Siorapaluk, 125 mi. north of Thule, winter sledge trips were made to collect demographic. economic and social data on the Eskimos. Author counted 302 Polar Eskimos in ten different settlements. Genealogies were traced. Birth and death rates are discussed; also effects on Eskimo society of contact with white men and possibility of successful integration. In spring, geomorphic expedition was made around Kane Basin. Most significant geomorphic factor appears to be extreme aridity. No intense wind erosion occurs. Glacial erosion was limited, and present frost action is weak. Water erosion in summer produces steep slopes which undergo parallel recession. Present processes seem insufficient to account for present landscape. Copy seen: DLC.

Results of an investigation carried out by the Laboratory for Spore-Pollen Analysis of the Institute of Geography of the Academy of Sciences. Ten tree species were studied: pollen of spruce (Picea excelsa Link), pine (Pinus silvestris L.), birch (Betula alba L.), alder (Alnus glutinosa Gaertn.), oak (Quercus robur L.), linden (Tilia cordata Mill.), elm (Ulmus L.) and hornbeam (Carpinus betulus L.). Quantitative data are given on their pollen found in the upper soils within, also outside their area, including arctic regions (cf. text maps); these data are compared and discussed. Pollen of pine proved the most volatile; while that of oak, linden, elm and hornbeam appear beyond their tree lines only in negligible Copy seen: DLC. quantity.

Abstract of paper presented at the 52nd Annual Meeting of the Association, Montreal, Apr. 1–5, 1956. Norwegian, Swedish, and Finnish Lapland may be considered a single region united by common economic and social problems, notably isolation and neglect. Events of World War II, post-war reconstruction, strategic considerations in the "Cold War," have drawn attention to this area. Each of its three sections is economically unstable, but not the area as a whole. All three countries plan economic rehabilitation programs, Finland's involving international cooperation.

46596. MALONE, G. K., and T. W. SELBY. Relationship of low temperature cranking resistance to viscosity characteristics of multigrade engine oils. (SAE transactions, 1956. v. 64, p. 602–607, illus., diagrs., tables.) Discussion p. 621–24.

Results are given of a full-scale cranking study using four brands of commercial 10W and 10W-30 oils in cars at 0° F, supported by low-temperature viscometric laboratory analysis. A maximum difference of 30 rpm in cranking speeds was obtained for 10W-30 multigrade oils. A maximum difference of 19 rpm was found between 10W and 10W-30 oils of the same brand. The low-temperature performance of multigrade oils is often not equivalent, grade for grade, to single-

grade oils. The results further showed that low-temperature oils should be classified, based on determined viscosity at low temperatures and at a specified shear rate. **Copy seen:** DLC.

**46599.** MAMEN, CHRIS. Mining on the Arctic Circle. (Canadian mining journal, June 1956. v. 77, no. 6, p. 90-94, 2 illus., table.)

At the Eldorado mine, Port Radium. Great Bear Lake, total underground lateral development exceeded 23 miles at the end of 1955. Approx. 175 tons of uranium ore are mined and treated daily by cut-and-fill methods, and the same amount of old mill tailings are reclaimed and retreated by dredging. Heavy water flows encountered on deeper mine levels necessitate sealing off a whole ore shoot before normal stope development starts. Diamond drilling, grouting, and stoping operations are described and performance data given. Ore control, hoisting and transportation, ventilation, and mine drainage (with pump data) are dealt with; also electric power, compressed air, heating, rolling stock, personnel, mine safety, and accommodation for staff and employees. Supplies and equipment are brought in by barge during the summer shipping season.

46600. MANENTE, BERNARDINO A. Bases pour une nouvelle explication du mécanisme de l'hibernation artificielle; l'action de la clorpromazine sur le métabolisme de l'eau et son importance dans la production des phénomènes neuroplégiques. (Anesthésie et analgésie, 1956. t. 13, no. 4, p. 694–701, tables.) 6 refs. Text in French. Summary in English. Title tr.: Basis for a new explanation of the mechanism of artificial hibernation; effect of chlorpromazine upon the water metabolism and its importance in the production of neuroplegic phenomena.

Report of observations on dogs given the drug intravenously. Its effect appears in the first stage of neuroplegia and elicits a "short circuit" in all functional activities without producing death. This is effected by the re-distribution of water in the three fluid systems of the organism, bringing about an actual control of water metabolism.

46602. MANKAU, SAROJAM K. Studies on the helminth Echinococcus alveolaris (Klemm, 1883) from St. Lawrence Island, Alaska; development of broad capsules and scolices in alveolar cysts, in white mice. (American Microscopical Society, Transactions, Oct. 1956. v. 75, no. 4, p. 401–406, illus.) 2 refs.

A study of the parasite development in mice fed with gravid segments obtained from infected arctic foxes of St. Lawrence Island, Alaska. Alveolar cysts were fertile in 70 percent of the animals infected. Scolex production began 3-4 months after infection; the cysts often produced multiple broad capsules; sterile and fertile cysts developed side by side in the same cystic mass. Copy seen: DSI.

46603. MANKER, ERNST MAURITZ, 1893- . Borg Mesch. (Till fjälls 1956. årg. 28, p. 67, port.) Text in Swedish. Title tr.: Borg Mesch.

Obituary of this pioneer in Swedish mountain photography (1869–1956), the first to climb several peaks with photographic equipment, e. g. Kebnekaise in 1903. He recorded Lapp life and civilization also the development of Kiruna from wilderness to a modern mining community. He took part in a Nobile rescue expedition in 1927. Copy seen: SPRI.

46604. MANKER, ERNST MAURITZ, 1893- . Kultplatsen Pålnovuoddo. (Norrbottens läns hembygdsförening. Årsbok 1956, p. 55-66, illus.) 9 refs. Text in Swedish. Title tr.: The cult site at Pålnovuoddo.

Describes a Lappish sacred place in a valley about one km., on the Norwegian frontier, and north of Torneträsk (68°22' N. 19°06' E.). Idols, also reindeer horns and bones were found when the site was excavated in 1908 and 1909, and the writer visited it in 1952. The site is located where the valley becomes narrow with the sides steep. It probably dates from the era of the reindeer hunters as an extensive system of traps has been found in the valley.

Copy seen: SPRI.

46605. MANKER, ERNST MAURITZ, 1893- . Lapparna och renarna. (Samefolkets egen tidning, Dec. 1954. årg. 36, nr. 4, p. 2–3, illus., port.) Text in Swedish. *Title tr.:* Lapps and reindeer.

Reindeer husbandry was well developed in northern Scandinavia by the ninth century, an outgrowth of a kind of game protection exercised by hunters. Trap systems ingeniously constructed and arranged have been found, consisting of several hundred individual traps, extending for miles. These systems presuppose large groups of hunters, corresponding to the groups of nomadic reindeer herders of a later period. The organization of such groups ("sitah") is described: the reindeer are privately owned but tended collectively.

46609. MANNING, THOMAS HENRY, 1911—, and others. The birds of Banks Island. Ottawa, Ministry of Northern Affairs and National Resources, 1956. iv, 144 p., illus., tables, map. (Canada. National Museum. Bulletin no. 143. Biological series no. 48.) About 150 refs. Other authors: E. O. Hohn and A. H. Maepherson.

Contains a study of the ecology, taxonomy, behavior, etc., of 62 species of birds, based on field work and collections made during 1952 and 1953. A series of general introductory sections deal with material and methods of study: field work; population estimates; weather, topography and vegetation; collecting and recording stations and, earlier work on the Island's birds. This is followed by the systematic list (p. 18-128) with information and data on occurrence and distribution, habitat, morphometry, color and color variants, nesting habits, observations on the young, migration, earlier studies, etc. Copy seen: DI.

46610. MANNING, THOMAS HENRY, 1911— . Narrative of a second Defence Research Board expedition to Banks Island, with notes on the country and its history. (Arctic, 1956. v. 9, no. 1-2, p. 3-77, 50 illus., 2 text maps.) 80 refs.

During July-Aug. 1953, the writer and I. M. Sparrow completed the circumnavigation of Banks Island by canoe, started in 1952 (Arctic Bibliography, No. 30678). He describes archeological work on Thule Eskimo houses at Cape Kellet in May-June, the overland journey to Castel Bay on the north coast, and the trip south by canoe. Notes and photographs of topographic features were made: tide readings taken; bird, mammal, plant, and geological specimens collected. Following the trip narrative, is a documented account of the exploration of Banks Island from its discovery by Beechey and Parry in 1820 to work of the Burton Island, Northwind and Labrador in 1954. Eskimo occupation is traced on the basis of archeological evidence and explorers' accounts. Topographic and geologic features of the southern highlands and coastal regions are described. Appendices (5) list: fossils collected; pollen analyses; manuscript charts from M'Clure's and Collinson's voyages, relating to the island; such landmarks as beacons, caches, cairns, etc., containing records and recent Eskimo houses and tent frames; 33 new and approved geographic names (45 earlier approved and a few unidentified are added.)

46624. MARKGREN, MARTIN. Glaciation och landskap i norra Fennoskandia. (Svensk geografisk årsbok 1956. Årg. 32, p. 7–43, illus., map.) 74 refs. Text in Swedish. Summary in English. Title tr.: Glaciation and landscape in northern Fennoscandia.

Investigations in the central Kölen mountains do not support the hypothesis that some of the highest mountains from south Lapland to the Varanger peninsula were persisting nunataks during the Pleistocene glaciation. In the Lofoten area, climatic and morphological conditions may have favored nunataks, whether persisting or not. The Kölen slopes drainage (varieties of two systems, one ortholateral, the other radially arranged) was studied but no nunatak lakes found in the investigated area. Transport of material by the ice from the west predominates over that from the east in north Sweden. The traces of the last ice divide were followed further to the west than earlier expected. There were in fact two late parallel ice divides, and in the end scattered centers alone were left, coinciding with the recent glacial centers which must also have acted as initial feeding areas. There was one southerly ice mass, draining into the Atlantic and the Baltic, and one northerly draining into the Arctic Ocean. The older modifications of the glacial landscape were studied by means of "hällanalys", i. e. an analysis of the glacial surfaces of outcropping rocks. This method is briefly discussed and some important results of the analysis are given. The author isolated and followed glacial erosion forms in different material from very small simple forms to greater and more complicated ones and found the forms and phases dependent on the structures of the eroded material A certain rhythm is observed in the glacial erosion but not elucidated. The role of recent and ancient frost action is also discussed. Copy seen: DLC.

Reports author's examination of the most important of the supposed nunataks in Swedish Lapland and adjacent parts of Finland and Norway. Glacial erosion marks and glacial deposits were investigated. The existence of persisting nunataks is not indicated for some areas, e. g. Pältsa-Måskokaise, (69° N. 20°13' E.) and most probably the highest of the Sarek mountains (67°27' N. 17°40' E.); it is established that they were covered by the ice. On the Norwegian coast the question is more complicated and demands further investigation.

46626. MARKGREN, MARTIN. On ice-age stages in S. Lapland, especially in the valley of Lake Malgomaj and Lake Kultsjön. (Geologiska föreningen, Stockholm. Förhandlingar, 1951. bd. 73, häfte 3, no. 466, p. 445–54, diagr., 3 text maps.) 27 refs.

Preliminary results of three years' field study, near Blaikfjäll (approx. 65°05' N. 15°30' E.). Ice-dammed lake shore marks, eskers, deltas, boulder trains, boulder counts, drainage features, terraces, col gullies, glacial striae and morainal material are considered. Comparison is made with the glacial history of northern Swedish Lapland, in a discussion of the values and problems of using these features as evidence of relationships to the last ice of the Swedish-Norwegian border region.

**46627.** MARKIN, ARKADIĬ. The Angara cascade. (News, Mar. 1, 1956, no. 5 (112), p. 22-23, illus.)

Explains project for a series of hydroelectric stations on the Angara River: the first near Irkutsk, under construction; the second, at Bratsk, with a 3,200,000 kw. potential, to be built during the Sixth Five-Year Plan (1955–60). The latter involves damming the Padun Rapids and will make the Yenisey-Angara navigable for sea-going vessels up to Lake Baykal. Copy seen: DLC.

46628. MARKIN, ARKADII. Karandash inzhenera risuet novoe litso planety. (Tekhnika molodezhi, June 1956. god 24, no. 6, p. 20–26, illus. maps.) Text in Russian. *Title tr.:* The engineer's pencil draws a new face on the planet.

Significance of various hydrological projects for power development and improvement of climatic conditions of six continents is discussed. Among these projects, attention is given to that of A. A. Shul'ga, a modification and expansion of the old M. M. Davydov project to create a mid-Siberian sea with a set of dams on the rivers Ob', Irtysh, Yenisey, Angara, etc. The modification consists of a diversion of the southern portion of the rivers in a westerly direction by means of canals and dams with gigantic hydroelectric plants; the northern parts of the Lena, Olekma, Aldan and other arctic rivers would be directed to the lower Yenisey and Ob' Rivers. This project also involves construction of a large dam across Bering Strait to control the Pacific Ocean current and to re-direct it into the arctic sea. Copy seen: DLC.

**46629.** MARKIN, ARKADII. Weather factory in Bering Strait. (News, Jan. 1, 1956. no. 1 (108), p. 22–24, maps.)

Describes Soviet plan to close the Bering Strait by a dam to prevent cold current entering the Pacific. An artificial warm current would be generated by a 2-3,000,000 kwt. atomic power station installed in this dam, with a cross-section of 1.3 sq. mi. Flowing into the Arctic Basin, this "man-made Gulf Stream" would ameliorate climate of adjacent regions; thus doing away with the permafrost belt and the Siberian anti-cyclone.

Most Soviet investigators assume three glacial and two interglacial periods in European U. S. S. R., although some favor seven or eight glaciations and others only one. In Asiatic U. S. S. R. only the western section underwent continental glaciation. Local mountain glaciation occurred in the central and eastern regions. Periods of formation of perennially frozen ground correspond to the glacial periods. Postglacial time is divided into only four climatic phases, as the existence of the Sub-boreal is questioned.

46633. MARKS, M. Klimat Eniseïska po dvíenadísatilíetnim nablúdeniíam 1871–1883. (Akademiía nauk SSSR. Zapiski, 1887. t. 55, knizhka 1, p. 132–63, tables.) Text in Russian. *Title* tr.: The climate of Yeniseysk on the basis of twelve years' observations, 1871–1883.

Climatic conditions and methods of meteorological observation are described, with tabulated monthly and annual average values for each year. Types and main characteristics of meteorological instruments are given with occasional corrections. Variations in barometric pressure during the 12-year period ranged 727.2-790.7 mm. The lowest air temperature observed was -58.6° C. on Jan. 1872 (records of Gmelin -84.4° C., and Shapp, -87.5° C. in 1873 are discounted). Low temperature conditions were found to restrict rapid movement by man and animals. Snow storm ("purga") with circular turbulent wind and temperature about -15° C. produced more severe physiological effects than very low temperature alone. The warmest weather was observed during June-August with temperatures from 34.7 to 2.1° C. (without frost). Data are added on freezing and opening of the Yenisey River 1826-1854. Ice-cover duration averaged about 180 days (Nov. 19-May 6). The freezeup extremes ranged from Nov. 2 (1840) to Dec. 18 (1881), while break-up dates varied between April 21 (1859) and May Copy seen: DLC. 19 (1883).

General hypothermia of 20° C. interrupted daily for an hour retarded the growth of Guerin's myeloma T. 58 and increased the rate of survival. Local hypothermia of the area into which the tumor was transplanted (tail) prevented its growth, but the animals died from metastases.

46636. MARSH, GORDON H. A stone lamp from Yukon Island, Alaska. (Alaska. University. Anthropological papers, May 1956. v. 4, no. 2, p. 113–15, illus.) Refs. in text.

Reports the chance find made in 1955 by George Yuth on the beach of Kachemak Bay. The stone lamp, 17 in. long, 9-5½ in. wide has unusual carving of a reclining sea mammal on its wick end, also a human head with Eskimoid face on its oil reservoir. It belongs to an early Eskimo-Aleut stratum on Alaska's south coast.

46638. MARSHALL, ROBERT, 1901–1939. Arctic wilderness. Edited, with an introd. by George Marshall; foreword by A. Starker Leopold. Berkeley, Uni-

versity of California Press, 1956. xxvi, 171 p. 30 illus., 6 maps (1 fold.)

Account of Marshall's four trips to the northern Koyukuk drainage basin and the Brooks Range in the area 67°-68°15' N. 149°-154° W., northern Alaska, in 1929, 1930-1931, 1938, and 1939. Scenforests, settlement of Wiseman (67°20' N. 150°13' W.), Eskimo and white "characters" of the region, etc., are described. Mountain-climbing experiences (about 28 peaks, mostly first ascents), several winter trips, etc., are recounted. Author made growth studies of many stands of trees and carried out topographic mapping. He was Chief. Division of Recreation and Lands, U. S. Forest Service. Introductory sketch of his life and writings is contributed by his brother. Copy seen: DLC.

Longitudinal-wave propagation was measured at a point situated 25 km. in the interior of the Inland Ice where the ice thickness is near 800 m. during the French Polar Expeditions of 1949. Velocity measurements were made in six directions along regular hexagons. A maximum velocity of about 3700 m./sec. was measured along the west-east axis, the direction of surface fissures and the apparent direction of maximum compression. The velocity increased by about 250 m./sec. at a depth of 300 m. The velocity anisotropy can be attributed to pressure at the interior of the ice. Copy seen: DLC.

46642. MARTIN, JEAN, 1908—, and others. Groenland, 1948—1952; gravinétrie, 1<sup>re</sup> partie, valeurs de g. Paris, Expéditions polaires françaises, 1954. 152 p. illus., diagrs., tables. (Expéditions polaires françaises. Expéditions arctiques, 1948—52. Résultats scientifiques, no. N. III, 3.) Text in French. Title tr: Greenland, 1948—1952; gravimetry part 1, g values. Other authors: P. Stahl, F. Munck, and A. Joset.

Gravity data obtained on the Greenland icecap, at secondary stations in Iceland, and at Port Victor, Jakobshavn, Godthaab, Ivigtut, Faeringerhavn, Holsteinsborg, and Godhavn on the west coast of Greenland during the summers of 1948 and 1951 are tabulated. The high-range Western gravimeters employed are described, and methods of analysis are discussed. Possible closure errors and calibration from numerous ties are described. Appended (p. 131–48) are describtions and illus. of the stations.

Materialy k osnovam uchenifa o merzlykh zonakh zemnof kory, 1956. vyp. 3, p. 167–78, graphs.) 10 refs. Text in Russian. Title tr.: Derivation of a basic equation for heat transmission in freezing and thawing ground.

The influence of various factors on heat transmission in ground at temperatures near 0° C. is discussed, considering heat conductivity, convection and heat transmission with water filtration and migration as primary factors for determining thermal conditions within freezing and thawing strata. The process of deglaciation is mathematically expressed, using data of Kersten and Nersesova, with linear relation for simple cases and with non-linear differential equations for more complicated thermophysical processes. Equations are given separately

for ground layers with and without major changes in water state, also for conditions along the separating boundary.

Materialy k osnovam ucheniâ o merzlykh zonakh zemnoĭ kory, 1956. vyp. 3, p. 179–85.) 6 refs. Text in Russian. Title tr.: The calorimetric method for determinating the amount of unfrozen water within frozen ground.

Theoretical problems in using the calorimetric method for measurements in frozen ground are discussed. The accuracy of the measuring procedure described by Nersesova. (No. 41569-41571) is criticized: the proper theoretical basis is lacking for determination of specific heat and heat of ice fusion in thinly dispersed ground (clays, argillaceous soils) freezing at temperatures below 0° C. Computed heat is affected by heat of adsorption and by overcrystallization of strongly bound water molecules. This crystallization is accompanied by liberation of heat of phase transformation, which increases the effective specific heat of bound water. Wet ground at freezing is differentiated into ice and mineral lamination, but at the melting the process is reversed. In view of these factors, use of the calorimetric method requires further study. National Security, 1946? 5 1. diagr.,
text map.

Outlines a project in arctic operations initiated at the Massachusetts Institute of Technology by the Research Board of National Security as an agency (Feb. 1945-Mar. 1946) of the National Academy of Sciences, and with United States Army and Navy support. The project proposes to consider the operating problems involved in the establishment of arctic meteorological stations, and to investigate the application thereto of recent developments of equipment materials and supplies. A full operating plan will be developed for the establishment of an assumed ultimate network of arctic stations. Copy seen: DWB.

46654. MASSACHUSETTS INSTI-TUTE OF TECHNOLOGY. Dept. of Civil and Sanitary Engineering. Soil Engineering Division. Design and operation of an hydraulic analog computer for studies of freezing and thawing of soils. Boston, Mass., Arctic Construction and Frost Effects Laboratory, May 1956, ix, 43 p. illus., 7 diagrs. (5 fold.), charts, tables. (U.S. Army. Corps of Engineers. Contract no. DA-19-016-Eng-2743.)

"The design, construction, and operation of the hydraulic analog computer developed by the Corps of Engineers in order to improve techniques for predicting subsurface temperatures, especially frost and thaw penetration below airfield pavements, are described. The computer and the analogous relationships among parameters in the thermal and fluid-flow systems are discussed, and the developments in hydraulic analogs in various countries are outlined. The design requirements, including the simulation of freezing and thawing, the selection of the working fluid, and the assembly of the various components of the computer are described. The programming procedures for the computer are outlined, and the solution for a sample problem is given. The computer has been found very useful for solving complex one-dimensional freezing and thawing problems in soil, and its applicability for solving other diffusion problems in engineering is broad."-SIPRE. Laboratory of Climatology. Publications in climatology, v. 9, no. 1, Arctic Institute of North America, Technical report no. 1.)

The results of systematic investigations from June-Sept. 1956 on the heat and moisture exchange between the earth and the atmosphere are reported, and the methods of measurement and instruments used are described. Observations were conducted in an open area of highcentered polygons, a low, poorly drained area with low-centered polygons, and on a dry ridge area. Studies were made on wind velocity and air temperatures 20 cm., 40 cm., 80 cm., and 160 cm., above the ground, soil temperatures to a depth of 25 cm. (depth of permafrost thaw), dew-point temperatures, radiation, evapotranspiration, precipitation, and vapor pressure. Data on the results of measurements and the computed heat budget are tabulated; the instruments used are evaluated; and suggestions for further research are made.

Text in French. Title tr.: A study of migration and winter quarters of the Caspian tern Hydroprogne caspia (Pallas) in Eurasia.

This cosmopolitan bird, known on five continents, nests chiefly in Swedish Lapland (Luleå and Piteå Lappmark) and northern Finland, and migrates to winter grounds in the Sudan, Tunisia and Egypt. The population of the Caspian-Azov Sea region migrates to Tunisia, and that of Turkestan to India (cf. maps). Banding and recovery data are tabulated. The oldest birds are 10-11 years in Europe, 9 years in Asia, and 20-22 years in North America. Copy seen: DSI.

Rapports scientifiques des Expéditions polaires françaises S IV 2. Activité magnétique dans les régions polaires. (Annales de géophysique, 1956. t. 12, no. 1, p. 84–101, diagrs., maps, tables.) 16 refs. Text in French. Title tr.: Scientific reports of the Expéditions polaires françaises S IV 2. Magnetic activity in the polar regions.

Data are analyzed from 52 stations, mostly located in the northern (22) and southern (11) polar areas. Two types of activity are distinguished and defined. The first type which predominates at the interior of the auroral zones is interpreted on the basis of the Chapman-Ferraro storms. Certain properties of the second type, which predominates over the rest of the globe, appear to confirm the importance of the equator in the formation of auroras and rays.

Terre Adélie, 1951–1952; magnétisme
terrestre, fasc. II; activité magnétique
dans les régions polaires. Paris, Expéditions polaires françaises, 1955. 128 p.
illus., maps, charts, diagrs. (Expéditions
polaires françaises. Expéditions antarctiques. Résultats scientifiques, no. S.

IV. 2). Text in French. *Title tr.:* Adélie Land 1951–1952; terrestrial magnetism, fasc. 2.; magnetic activity in the polar regions.

Magnetic activity in polar regions is analyzed using data from 49 stations above 50° lat., 38 of which are in the Arctic. A list of the stations is given together with their geographical coordinates and periods of observation (mostly 1932-33, some subsequently to 1952, or 1882/83). Maps showing the locations of the stations are also included. During 1951-52, magnetic disturbances were regularly recorded at Adélie Land during the daytime, the intensity of which increased from winter to summer. This led to the present study, and the data collected and analyzed are approximately equivalent to 100 years of recordings. Two distinct types of activity were distinguished and studied: N activity (night maximum) and J activity (day maximum). The time and space variations of each are described in detail. The marked differences between the two suggest that both cannot be attributed to the same mechanism of corpuscular origin. An attempt is made to explain the difference on theoretical grounds.

46671. MAYR, ERNST, 1904—. Geographical character gradients and climatic adaptation. (Evolution, Mar. 1956. v. 10, no. 1, p. 105–108.) 15 refs.

Author takes issue with the statements of Scholander (No. 42332) and points out that the so-called "climatic rules" or "ecological rules" are not laws and have many exceptions; that they are valid within species only, and that adaptations to local conditions do not play a role in "phylogenetic engineering" as claimed by Scholander. Also, their existence does not preclude the cold-adaptive function

of other factors of a physiologic or morphologic nature. Scholander's reply: No. 47842. Copy seen: DLC.

Trudy 1956. vyp. 1, Materialy o prirodnykh uslovifākh i sel'skom khozfāfstve figo-zapada fAkutskof ASSR, p. 135–75, tables.) 22 refs. Text in Russian. Title tr.: Microbiological character of turforest and humus-carbonate soils in the Olekminsk district, Yakut A. S. S. R.

A schematic outline of the basic microbiological processes in these soils based on an investigation during 1952–53. Following an historical outline of Russian soil bacteriology, the author deals first with the yellow, turf-forest soils, their chemical and physical properties; bacterial components, nitrate and ammonia storage and the cellulose-splitting microorganisms. Sections from humus-carbonate soils are discussed next, as to their plant cover, chemical and physical traits, bacterial content and actions, N-fixing bacteria and cellulose-splitting micro-

organisms. The forest-meadow soils are dealt with and discussed in a similar way.

46675. MAZOUR, ANATOLE GRI-GOREVICH, 1900- . Finland between East and West. Princeton, N. J., Van Nostrand, 1956. xiv, 298 p. illus., ports, text maps. approx. 140 refs.

A political history of Finland, dealing briefly with Finnish-Swedish-Russian relations from about the 12th century, Finnish struggle for independence, attained in 1917, problems of the new republic; in more detail, the World War II period: war with Russia 1939-1940, alliance with Germany until 1944, then hostilities in northern Finland 1944-1945; political and economic results of the war: relations with Russia to late 1955. Northern boundary and population problems are discussed. Appended (p. 209-282) are texts of documents of Soviet-Finnish relations since 1918, including decisions on positions of the Finnish boundary in the North, Finnish rights in the Petsamo (Pechenga) region during the 1920-1925 period, displaced population, Finnish ships in the Barents Sea, etc. Copy seen: DLC.

46676. MAZUR, P. Studies on the effects of subzero temperatures on the viability of spores of Aspergillus flavus, 1; the effect of rate of warming. (Journal of general physiology, July 1956. v. 39, no. 6, p. 869–88, illus. tables.) 23 refs.

Survival of spores of this mold suspended in distilled water and rapidly cooled, down to —75° C. was found to depend primarily on the rate of subsequent rewarming: the quicker the latter, the higher was the survival rate. Lethal effects of slow warming were more pronounced between about —20° and 0° C. than between —70° and —20° C. The harmful effects of slow warming were also noted with horse serum, sucrose or salt solutions used for suspending the spores.

Materialy k osnovam uchenifa o merzlykh zonakh zemnol kory, 1955. vyp. 2, p. 59-64.) 4 refs. Text in Russian. Title tr.: Shortcomings in the classification of ground water in perma-

"Principles of classification applied by Tolstikhin and others to ground water in permafrost are considered inadequate. They ignore the part played by geological conditions in the formation and circulation of ground water, and consider ground ice as a modified form of liquid only. Sub-, intra-, and suprapermafrost waters are also deficient as terms, because the effects of permafrost vary in moist soil and rocks as well as in strata containing bound water only. A revised classification should be based on geocryological concepts of the formation, circulation, and chemical interaction of ground water, and should consider ground ice as a solid, not as a modified liquid form."—SIPRE.

The development of permafrostology in the U.S.S.R. since the mid-19th century is briefly described, and theoretical and practical problems influencing progress of the science are discussed. Construction of the Trans-Siberian Railroad, and of highways and buildings resulted in intense study of permafrost. especially after the establishment of the Commission on Permafrostology in 1930. Considerable data on the distribution of permafrost and its physical and mechanical properties were collected during 1927-1941. Theoretical generalization of practical results leads to development of a single theory on geocryology and two practical methods for construction with preservation or liquidation of the permafrost conditions. 46694. MELEKHOV, IVAN STEPANO-Povyshenie produktivnosti severnykh lesov. (Lesnoe khozfalstvo, Mar. 1956. t. 9, no. 3, p. 7-12.) Text in

Russian. Title tr.: Increase in produc-

tivity of the northern forests.

Higher productivity and further development of the forest industry are discussed, particularly in the Arkhangel'skaya Oblast'. Protective action is suggested against fire, insects, fungi, and for preservation of young trees; also the rational use of lumber and by-products. Various measures are recommended: improvement in growth of trees: change in species, selection of suitable foliate types, soil improvements, better forest care: cleaning, trimming, cutting, etc. Melioration in drainage is proposed by reclaiming forested marshland, draining neighboring marshes, improving the existing system of springs, brooks, trenches, etc. The results of earlier work in this and other regions are analyzed.

46701. MELLQUIST, CURT, and T. SANDBERG. Odontological studies of about 1,400 mediaeval skulls from Haland and Scania in Sweden and from the Norse colony in Greenland, and a contribution to the knowledge of their anthropology. (Odontologisk tidskrift, 1939. v. 47, no. 3 B (Suppl.), p. 1–83, illus., tables.) Approx. 230 refs. Summary by the authors in German appeared in: Deutsche Zahn-, Mund- und Kieferheilkunde, 1940. Bd. 7, Heft 1, p. 1–8.

Contains in part 1 (p. 5-47) an odontological study of 10th-16th century skulls. 102 of them from Norse settlements in West Greenland: the material represents both sexes and various age groups. Caries, marginal atrophy, abrasion, occlusal relation, etc., were examined frequently with the aid of x-rays. The relation between diet and caries is discussed and the complete absence of the latter from the Greenland material pointed out. The differences in diet. animal in Greenland, largely cereal in Scandinavia, is considered responsible for these conditions. Pt. 2 (p. 48-74) deals with the anthropology of 374 skulls (or parts of them) from Sweden and 54 from Greenland Norsemen, with comparison between the two groups.

46705. MENĪAĬLOV, ALEKSANDR ALEKSEEVICH. Defatel'nost' Kamchatskoī vulkanologicheskoī stantšii v 1947 g. (Akademifā nauk SSSR. Kamchatskafā vulkanologicheskafā stantšifā, Būlleten', 1949, no. 16, p. 22–25, illus.) Text in Russian. *Title tr.:* Activities of the Kamchatska Volcanological Station in 1947.

Reports results of observations carried out at Klyuchi, also in special huts on the slopes of Shiveluch and Klyuchevskiy volcanoes and during seven field trips of station personnel. Shiveluch continued to erupt; all other active volcanoes displayed only fumarolic activity; six volcanic and six tectonic earthquakes were registered.

Copy seen: DLC.

46706. MENĨAĬLOV, ALEKSANDR ALEKSEEVICH. Defatel'nost' Klûchevskogo vulkana v 1946–1948 gg. (Akademiâ nauk SSSR. Kamchatskafa vulkanologicheskafa stanfsifa. Bfülleter', 1953, no. 17, p. 24–26, table.) Text in Russian. Title tr.: Activity of Klyuchevskiy Volcano in 1946–1948.

Except for the cruption of a new lateral cone Apakhonchich in Oct. 1946, this volcano's activity was limited to ejection of vapor; data of its fumarolic activity in 1947 are given in tabular form; ascent of its summit in Aug. 1948 by a party under S. I. Naboko is noted. Cf. No. 46917. Copy seen: DLC.

46707. MENÑALOV ALEKSANDR ALEKSEEVICH, and others. Izverzhenie Shivelucha letom 1946 g. (Akademíña nauk SSSR. Kamchatskaña vulkanologicheskaña stanfsiña. Bûlleten', 1949, no. 16, p. 3-11, illus.) Text in Russian. Other authors: S. I. Naboko, N. D. Tabakov, L. A. Basharina. Title tr.: The eruption of Shiveluch in summer 1946.

Contains description of the eruptive activity of this volcano and of its lateral vent Suyelich during Aug.—Nov. 1946, based chiefly on the authors' long distance observations from the Volcanological Station in Klyuchi and on their three trips to Suyelich.

Copy seen: DLC.

46708. MENTATLOV, ALEKSANDR ALEKSEEVICH. Izverzhenie vulkana Shiveluch v 1944–1948 gg. (Akademifa nauk SSSR. Kamchatskafa vulkanologicheska a stantsifa. Bülleten', 1953, no. 18, p. 3–24, illus., diagrs.) 14 refs. Text in Russian. *Title tr.:* Eruption of Shiveluch Volcano in 1941–1948.

After 15 years of only fumarolic activity, signs of eruption were noticed on Shiveluch in Nov.-Dec. 1944; a new lateral cone, Suyelich formed on the southeast slope, and by the end of 1947 the volcanic matter ejected amounted to 125 million cu. m. From Sept. 1946, the eruption was systematically observed by the Volcanological Station, and the day-to-day conditions are diagrammed. Tabular data on lava temperature and chemical composition of fumarole gases are given. Copy seen: DLC.

46709. MENſAĬLOV, ALEKSANDR ALEKSEVICH. Sostoſanie vulkana Tolbachik v 1946–1948 gg. (Akademiſa nauk SSSR. Kamchatskaſa vulkanologicheskaſa stantsiſa. Bſūlleten', 1953, no. 17, p. 41–45, illus.) 8 refs. Text in Russian. Title tr.: The state of Tolbachik Volcano in 1946–1948.

Account based on periodic observations of this volcano from the village of Kozyrevsk (40 km. distant), also on visits to its foothill, and an ascent to the summit on Aug. 6–7, 1948 with descent into the crater to its bottom. Except for a brief ejection of ashes on Feb. 9, 1947, the volcano's activity was manifested only in ejection of vapors.

46710. MENĪAĬLOV, ALEKSANDR ALEKSEEVICH. Vulkan Sheveluch; ego geologicheskoe stroenie, sostav i izverzhenifa. Moskva, Izd-vo Akademii nauk SSSR, 1955. 264 p. tables, illus., diagrs., plans. (Akademifa nauk SSSR. Laboratorifa vulkanologii. Trudy, vyp. 9.) Over 175 refs. Text in Russian. Title tr.: Shiveluch Volcano; its geological structure, composition and eruptions.

Monographic description of one of the main volcanoes of Kamchatka (56°39′ N. 161°18′ E.), in three parts: geological and petrographic outline (p. 11–114); current activity and eruptions in 1944–48 (p. 115–99); evolution of the magma and of the eruptions (p. 201–256). Shiveluch, it is concluded, is the "ripest" among the active volcanoes in Kamchatka, and its activity is declining. This study is based on extensive literature (over 175 items, Russian and foreign, are listed), on unpublished results of Soviet explorations and eye-witness reports, as well as the author's own long-distance observations

from Klyuchi village and his investigations on four trips to the volcano during 1946-48. A chronology of the eruptive activity of Shiveluch in 1946-48 is given (p. 126-46); and its exploration is traced (p. 5-7) from the time of Krasheninnikov. Copy seen: DLC.

Contains a general summary of the scientific research program and some of the specific problems to be studied; the Italian program. Copy seen: DGS.

46712. MENOVSHCHIKOV, GEORGIĬ ALEKSEEVICH. Ėskimosy. (*In:* Akademifa nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 934–49, illus.) 13 refs. Text in Russian. *Title tr:* Eskimos.

Describes the Asiatic Eskimos (1,292 in 1926) living along the coast of Chukotka from the Bering Strait to the Zaliv Kresta and on Vrangelya Ostrov. Their main settlements are Naukan, Chaplino, Sireniki and Uėl'kal'. Their past distribution, cultural, linguistic and ethnographic ties with the Chukchis, archeology and history are sketched. Their native economy and material culture are described: walrus hunting, sealing and whaling, hunting techniques and equipment (spear and harpoon with detachable bone or, rarely, iron head; inflated seal skin buoys, etc.), fishing, hunting (fox and polar fox), food (reindeer, sea mammals, sea weeds, mainly sea-kale). Their means of transportation are the kayak, baidara, dog-drawn sledges, and the kanrak, a hand-pulled short sled with walrus tusk runners known throughout the ancient Bering Sea culture area. Their dwellings are tents, mud-houses, and frame houses introduced in the 1890's by American traders. Their clothing, including bird parkas, and tattooing practised till the early 20th century are mentioned. The scant knowledge of their past social organization is noted and the ethnographic and folkloristic leads surveyed: traces of matriarchate surviving to the 20th century, importance of women in social and religious life,

exogamy, religious beliefs (animal and spirit worship, rites and festivals, shamanism). Communal and private ownership, trade and barter, the Eskimos' role as middlemen in the trade relations between Americans and Chukchis are also mentioned. The cultural and economic advances under the Soviet regime are emphasized: education, administration, creation of kolkhozes and motorized hunting and trapping stations, etc. The use of materials by the late N. B. Shnakenburg is acknowledged.

46716. MERCER, JOHN HAINS-WORTH, 1922— . Geomorphology and glacial history of southernmost Baffin Island. (Geological Society of America. Bulletin, May 1956. v. 67, no. 5, p. 553–70, 12 illus. on 4 plates, 3 text maps, cross-sections, table.) 42 refs.

This peninsula is a tilted peneplane, probably uplifted in late Pliocene, with a drowned coast along Hudson Strait and an escarpment facing Frobisher Bay. This latter coast is described from the head of the Bay to Jackman Sound near the southeast end of the peninsula; also the strand lines found up to 1425 ft. Most of the larger landforms were probably forming during the Pleistocene. In each glacial age the northwest part of the peninsula was apparently buried by an ice sheet before cirques could form, while in the southeast, cirque erosion advanced to maturity. In late Wisconsin the area was greatly depressed, then as sea level fell, the strand lines formed. Present small icecaps (Grinnell and Terra Nivea) are the rejuvenated relics of a larger ice sheet which wasted away, except on the highest parts of the peninsula, during a warm period in the recent past. Copy seen: DGS.

46717. MERCER, JOHN HAINS-WORTH, 1922— . The Grinnell and Terra Nivea ice caps, Baffin Island. (Journal of glaciology, Mar. 1956. v. 2, no. 19, p. 653–56, 4 illus., 2 text maps.) 5 refs.

Contains results of the author and W. Blake's investigations in 1952, and author's in 1953, on the "Kingaite Peninsula" (approx. 62°30′ N. 68° W.). The icecaps are the southernmost of a series on the eastern side of Ellesmere, Devon, and Baffin Islands. Highest point on Grinnell is 870 m. (2,854 ft.); Terra Nivea appears similar. Both icecaps are thin, general tendency is for slight retreat, but one large glacier of Grinnell is advancing. Economy of Grinnell is discussed. Equilibrium line is considerably lower than on the Penny

icecap to the north. Both firn and superimposed ice are important in the economy. **Copy seen:** DGS,

46718. MEREDITH, L. H., and others. Cosmic-ray intensity above the atmosphere at high latitudes. (Physical review, July 1955. v. 99, no. 1, p. 198–209, text map, diagr., 6 graphs, 6 tables.) 33 refs. Other authors: J. A. Van Allen and M. B. Gottlieb.

"The total charged particle cosmic ray intensity above the atmosphere has been measured with thin-walled Geiger counters . . . carried in balloon launched rockets The respective values of unidirectional particle intensity averaged over the upper hemisphere are:  $\overline{J}=0.44\pm0.01$ .  $\leq 0.50 \pm 0.05$ ,  $\leq 0.50 \pm 0.50$ , and  $= 0.48 \pm$ 0.01 (cm<sup>2</sup> sec sterad)-1. These results are consistent with the complete or nearly complete absence of primary cosmic rays having a magnetic rigidity less than 1.7 x 109 volts."-Author's Launchings were made off abstract. southern Newfoundland, and in northernmost Baffin Bay between 77°21'-31' N. 73°29'-30' W., Aug. 24-Sept. 3, 1952. Two further rockoon flights, with identical apparatus, made in 1953 off southern Labrador and southern Baffin, are reported in No. 46719. Copy seen: DLC.

46719. MEREDITH, L. H., and others. Direct detection of soft radiation above 50 kilometers in the auroral zone. (Physical review, Jan. 1955. v. 97, no. 1, p. 201–205, 4 graphs, 3 tables.) 7 refs. Other authors: M. B. Gottlieb and J. A. Van Allen.

Two high-altitude rocket flights of thin-walled Geiger tubes were launched from U. S. Coast Guard icebreaker Eastwind, July-Aug. 1953, at geomagnetic latitudes 64° and 74° N., geographic location 53°08′ N. 54°45′ W. off southern Labrador, and 62°30.5′ N. 64°13.5′ W. off southern Baffin. A considerable intensity of soft radiation was encountered above 50 km. altitude. No such radiation was found in flights of identical equipment made in 1952 at geomagnetic latitudes 88.5° and 55.6° (cf. No. 46718). The radiation is tentatively interpreted as the high-energy tail of the auroral spectrum. It may contain electrons.—From author's abstract.

**46721. MERRILL, C. L.** Notes on Aklavik relocation project, 1954. Abstract. (Canadian geographer, 1956. no.

7, p. 27.)

From Apr. to Aug. 1954 a team of five engineers and three specialists in geology and geography investigated possible sites for a new Aklavik on the Mackenzie delta. Location 33 air miles east of present town was selected. Early start of survey permitted examination of each site during winter, break-up, and summer conditions. Aerial reconnaissance was made by helicopter; ground survey was done by tractor, dog team, and boat. Various tests made on the sites are noted.

46722. MERTIE, JOHN BEAVER, 1888— . The Paleozoic geology of interior Alaska. (Washington Academy of Sciences. Journal, Feb. 4, 1926. v. 16,

no. 3, p. 78-79.)

Abstract: The oldest rocks in Alaska comprise a group, known collectively as the Birch Creek schist of pre-Ordovician age: overlaying them is a great thickness of slate, known as Tatalina group and including lower and middle Ordovician Middle Silurian rocks are widespread and form one of the best known markers in the Paleozoic section (Yukon-Tanana region). Overlaying them are Devonian rocks (granitic, sandstone and slate). The carboniferous rocks include basal sandstones and shales known as Noatak, Lisburne and chert formations. A regional uplift of Alaska began in late Carboniferous time culminating perhaps in the late Triassic. Another great elevation of interior Alaska occurred in Jurassic time. Copy seen: DLC.

46723. MERTIE, JOHN BEAVER, 1888- . The Pre-Cambrian sequence of Alaska and Yukon Territory with particular references to the Pelly gneiss. (Washington Academy of Sciences. Journal, July 19, 1929. v. 19, no. 13, p. 288-89.)

Abstract: deals with present subdivision of Precambrian sections of Alaska (Pelly gneiss, undifferentiated schists of igneous origin and Birch Creek schist of sedimentary origin), and of the Yukon (Pelly gneiss, amphibolites, sericites and chlorite schists and Nasina series); notes distribution of Pelly gneiss and other related rock formations.

46724. MERTIE, JOHN BEAVER, 1888— Repeated stream piracy in the Tolovana and Hess River basins, Alaska. (Washington Academy of Sciences. Journal, Feb. 4, 1919. v. 9, no. 4, p. 109–110.)

Contains discussion of stream piracy when Livengood Creek, a tributary of the Tolovana River, stole the headwater tributaries of the south fork of the Hess River; and subsequently when the same process was repeated under different physiographic conditions, whereby the second stream recovered a considerable proportion of its former drainage. The present watershed therefore represents the third recognizable period of stability.

46727. METCALF, WILLIAM GER-RISH, 1918— . On the formation of bottom water in the Norwegian Basin. (American Geophysical Union. Transactions, Aug. 1956. v. 36, no. 4, p. 596-600, diagrs., table.) Issued also as Contribution no. 739, Woods Hole Oceanographic Institution.

Oceanographic data collected in the central areas of the Norwegian Sea during Mar.-Apr. 1951 are presented and analyzed. The data generally support earlier theory that this water is formed at the surface between Svalbard and Iceland, and is by surface water cooled during March-early May. It is suggested however that this relatively heavy water moves to deeper layers by flow along isopycnal surfaces, which may be discontinuous. The earlier theory, that surface water reaches the bottom by

means of the gradual overturning of the water column to produce homogeneity, is not sustained. **Copy seen:** DLC.

46735. MEZHENNYĬ, A. A. Massovoe razmnozhenie babochki boſaryshniſsy A poria crataegi L. (Lepidoptera, Pieridae) v Ākutii. (Ēntomologicheskoe obozrenie, 1956. t. 35, vyp. 4, p. 803–804.) Text in Russian. Title tr: Mass increase of A poria crataegi L. population. (Lepidoptera, Pieridae) in Yakutia.

An outbreak of this butterfly pest is reported in the summers of 1954 and 1955 in the Olekma and Lena basins (Yakutsk and northward); damage done by the caterpillars to bilberry shrubs is stressed.

Copy seen: DLC.

46736. MEZHVILK, A. A. Molassy v ust'e Leny. (Akademiâ nauk SSSR. Doklady, May 11, 1956. t. 108, no. 2, p. 317-19.) 2 refs. Text in Russian. *Title tr.*: Molasse in the Lena River mouth.

Contains a study of low Permian tillites on Cape Krestyakh, and Stolb Island in the Lena delta. The various layers of these conglomerates in the 300 m. massif are noted and discussed. The upper coarse pebble layers, determined formerly as tillites are considered by the author as part of molasse strata. They belong not to the Permian but the middle Carboniferous period.

46738. MICHEL, HANS. Geology and petrology of the Borkafjäll region, southern Swedish Lapland. Academisch Proefschrift, Universiteit van Amsterdam. Breda, Broese & Peereboom, 1950. 138 p., 24 diagrs., 2 plates, 5 tables. (Amsterdam. Universiteit. Geologisch Instituut. Mededeling no. 169.) 40 refs. Text in English. Summary in Dutch.

The region 65°07'-65°17' N. 15°10'-15°25' E. has but two farm houses, a Lapp camp, and a few narrow paths. The vegetation below ca. 800 m. is fir and birch woods, and above that generally low growth and swamps; at the higher elevations (to ca. 1,400 m.) is barren The most conspicuous geologic feature of the region is the uniform dip of schistosity and foliation. The strike is generally NNE-SSW, and the dip WNW. Dip varies, but in general it decreases The rocks, generally older eastward. than lower Silurian, are treated as seven series, with considerable attention being given to one intervening thrust zone. No fossils were found.

**46741.** *MIDWEST ENGINEER.* Huts of wood defy the Antarctic. (Midwest engineer, Sept. 1956. v. 9, no. 4, p. 10–11.)

Members of Operation Deepfreeze reported that three unpainted wooden houses erected by Scott and Shackleton on Antarctica 45–54 years ago still are in good condition. Construction details of the huts are outlined as given in journals of the expeditions. The oldest house has a floor area of 36 ft. square and a double layer of wood sheathing. Another, measuring 33 x 19 ft., was prefabricated, and has a four-inch layer of granulated cork insulation. The third hut measured 50 x 25 ft., was built with two layers of seaweed insulation, each between two thicknesses of tongue-and-grooved boards Copy seen: DLC.

46744. MIKKELSEN, EJNAR, 1880—. Los Esquimales de Groenlandia oriental: desde la edad de piedra hasta la era atomica. (Boletin de estudios geograficos, Jan.—Mar. 1956. v. 3, no. 10, p. 8–18.) Text in Spanish. *Title tr.:* The Eskimos of East Greenland: from the Stone Age to the atomic era.

Account of these Eskimos' environment; visits of white men in 18th and 19th centuries; living conditions and customs as observed by Gustav Holm, establishment of the colony of Angmagssalik in 1894, and resulting changes in mode of living; Danish administration and regulations, past and present; establishment of Christianity, education, care of the old; present distribution of Eskimos in Angmagssalik Distrikt. Copy seen: DGS.

46745. MIKKELSEN, EJNAR, 1880—Scoresbysund kolonien 1924—55. (Grønland, Mar. 1956, nr. 3, p. 81—91, illus.) Text in Danish. *Title tr.:* The Scoresbysund settlement, 1924–55.

Reviews development of Scoresbysund, East Greenland, founded in 1924 by settlers from Angmagssalik. The Greenlanders have settled down in the new site. Ice conditions have proved satisfactory, and the sealing better than at Angmagssalik. In 1954 returns at Scoresbysund were 2,199.83 Danish crowns per 262.56 er./individual; at hunter and Angmagssalik, 251.43 and 67.85 er. Seals caught numbered respectively. 101.4/hunter and 12.9/inhabitant in Scoresbysund; 23.9/hunter and 5.3/inhabitant at Angmagssalik. The new settlement had 310 population, Jan. 1, 1954; more could make a living there. Copy seen: DLC.

MIKKOLA, AIMO NUSTAA, 1917–, see Ödman, O. H. R., and others. Den svensk-finska geologiska exkursionen i Tornedalen . . . 1948. 1949. No. 47136.

46746. MIKOLA, PEITSA UNTAMA, 1915- . Tree-ring research in Finland. (Tree-ring bulletin, Apr. 1956. v. 21, no. 1-4, p. 16-20, 3 tables.) 21 refs.

Research has emphasized (1) relation of tree growth to different climatic factors and the practical significance of growth variations, (2) recent climatic fluctuation and its effect on diameter growth. Dendrochronological dating has not been practised. Studies made on the northern timber line indicate dependence of diameter growth on temperatures of the growing season. No correlation has been found between precipitation and diameter growth. Large variation in width of annual rings is of particular interest in the timber-line region. Close correlation exists between tree-ring index series from different parts of Finland except for the northern timber line (68°-70° N.). Correlation between different parts of the Scandinavian timber line is high. Copy seen: DLC.

The work of the astronomical group on North Pole-2 consisted of determining the coordinates of the drifting station in the Arctic Basin north of Bering Strait and observing the azimuth for establishing the position of the ice floe. Procedures used for determining the coordinates and making the azimuthal observations as well as the equipment employed are described. April, May, and October proved the most favorable months for observations. Coordinates of the station are tabulated for 420 determinations. Data on orientation are tabulated, and changes in orientation are graphed.

Copy seen: DLC.

46753. MILLER, DAVID HEWITT, 1918- . The influence of snow cover on local climate in Greenland. (Journal of meteorology, Feb. 1956. v. 13, no. 1, p. 112-20, 5 graphs, 2 tables.) 49 refs. "Voelkov's classic theory of effect of snow cover on climate is revised using observations from various expeditions on the Greenland inland ice. In winter during storms, heat is brought in by advection and subsidence, and loss by long wave radiation is decreased. This heat is stored in the lower air and surface layer of snow. Between storms it is dissipated by long wave radiation and a local climate develops. The cycle lasts 7½ days and storage and dissipation amount to 100-150 cal/cm<sup>2</sup>. In summer there is a similar diurnal cycle, storage and dissipation between periods of high and low sun amounting to about 30 cal/ cm2. These thermal balances are shown in tables and graphs."-Meteorological abstracts & bibliography, Aug. 1956. v. 7, no. 8, p. 996. Copy seen: DLC.

MILLER, DON JOHN, 1919—, see Plafker, G. and D. J. Miller. Reconnaissance geology . . . Malaspina District . . . 1956. No. 47370.

46754. MILLER, JOHN CHARLES, 1893- . Geology of waterpower sites on Crater Lake, Long Lake, and the Speel River near Juneau, Alaska. Washington, D. C., 1956. 46 p. 8 maps (7 fold.). Mimeographed. (U. S. Geological Survey. Reports, open file series, no. 372.) 6 refs.

Contains results of investigations in the Tongass National Forest at the head of Speel Arm of Port Snettisham (approx. 58°10' N. 133°45' W.). Topography and drainage are described in some detail. The four dam sites investigated are at the outlets of Crater and Long Lakes, at the first gorge of the Speel River below its junction with Long River, and in the saddle between Indian Lake and Speel Arm. Bedrock at the sites is essentially quartz diorite containing varying proportions of hornblende and biotite. Topography, geology, structure, dam site possibilities, and availability of construction materials are considered for each site. The sites "appear to be geologically feasible for the construction of the various structures that would be required for power development."

46756. MILLER, MAYNARD MAL-COLM, 1921- . Floating islands. (Natural history, May 1956. v. 65, no. 5, p. 233-39, 274, 276, illus., maps, diagrs.) "The discovery of ice islands is reviewed, and observations made on a reconnaissance flight in Aug. 1951 are described. A sheet of ice moored to a glacier-free shore, projecting 50 mi. into the sea, was sighted between Phillips and Markham Bays of Ellesmere Island. There were distinct furrows on its surface parallel to the coastline, with clean snow on the ridges and meltwater in the depressions. The distance between ridges was 100-300 yd., and the height of the ridges was 5-15 ft. A similar sheet of ice about one sq. mi. in area was found drifting in the vicinity of the grounded ice. T-1 (which had not been seen for two years) was found 20 mi. north of Disraeli Bay. Its topography closely resembled that of the ice sheet. T-2 was located 150 miles beyond the North Pole. was about 200 ft. thick and had a smooth surface due, probably, to progressive melting and refreezing."—SIPRE. 46757. MILLER, MAYNARD MALCOLM, 1921— . Significance of the anomalous advances of Alaskan coastal glaciers. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1808–1809.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. Of the 16 glaciers of the Taku-Llewellyn system, Juneau Icefield, studied since 1946, 14 are retreating, although 10 advanced between 1895–1925. Taku and Hole-in-Wall Glaciers have continued to advance as result of upward shift in level of maximum solid precipitation over the Coast Range, 1885–1945, coincident with pronounced regional warming.

46759. MILLIGAN, G. C. Bibliography of geology of the Precambrian area of Manitoba to 1950. Winnipeg, King's Printer, 1951. 67 p. (Manitoba, Dept. of Mines and Natural Resources. Mines Branch. Publication 51-1.)

Approx. 475 references primarily on geology, not mining, are listed by author with subject and location (mining district) indexes. Maps (from Manitoba Mines Branch 1937–1950, and the Geological Survey of Canada 1917–1950), approx. 125 in all, are listed also. Many references to north-central and northwestern Manitoba are included. A similar bibliography on the post-Cambrian was compiled by Lillian B. Kerr, q. v. Copy seen: DGS.

46760. MILLIGAN, G. C. Geology of Beau-Cache Lake area, Granville Lake division, northern Manitoba. Winnipeg, King's Printer, 1951. 25 p. fold. map 24 x 28 in., diagr., table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 50-8.) 4 refs.

Map (scale 1 in.: 1/2 mi.) covers the area 56°23′-30′ N. 100°30′-40′ about 30 mi. southeast of Lynn Lake. Field work was done in Sept. 1950. Physical geography is briefly described. Bedrock is Precambrian. Folded and metamorphosed lavas and sediments of the Archean Wasekwan series are overlain by Sickle series sediments, folded and faulted to a lesser degree. Post-Sickle basic and granitic intrusives have invaded the older rocks. Some general trends and the fault systems are discussed; also geologic history. No mineral occurrences of economic importance are known. Mineralization on claims is described. Copy seen: DGS.

46761. MILLIGAN, G. C. Geology of the Laurie Lake area, Granville Lake division, northern Manitoba. Winnipeg, Queen's Printer, 1952. 31 p. 2 maps (1 fold. 28 x 41 in.), tables. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 50-7.) 6 refs.

Map (scale 1 in.: ½ mi.) covers the area 56°30′.45′ N. 101°45′—102° W., about 35 mi. southwest of Lynn Lake. Field work was done in summer 1950. Physical geography is briefly described. Consolidated rocks are Precambrian. A complex fault zone marks the contact between the metamorphosed lavas and sediments of the Archean Wasekwan series to the north and younger Sickle sediments to the south. Both Wasekwan and Sickle rocks appear to grade into Kisseynew-type gneisses. Granite intrudes the Wasekwan series, and pegmatites are common. Geological history

of the region is traced. Mineralization is described, and gold and copper values resulting from assays are given.

Notes mining of coal, gold, iron, copper, asphalt, and graphite in the Pechora region (67°40' N. 52°30' E.), platinum and gold on the Chukchi Peninsula, opalite and iron on Kola Peninsula; also sinking of oil wells at Ukhta, Pechora and Khatanga, and development of salt mines of that region. Chaunskaya Guba (69°20' N. 170° E.) is the most important tin-Little is known of producing area. Soviet development of Svalbard mineral Ore transport by river in Siberia is noted, also construction of 700-mile railway east from Murmansk track to coalfield on Kara Sea.

46770. MINING WORLD. What's happened to Alaskan gold mining and how can it be saved? (Mining world, Feb. 1956. v. 18, no. 2, p. 39.)

Declining gold placer mining industry is attributed to lack of proper financing; miner is forced to concentrate on production; prospecting is at a standstill. Peculiar conditions of mining in Alaska due to climate, frozen soils, etc., are briefly summarized. Financing program and a lending institution understanding Alaskan problems are needed.

Russian. Title tr.: High ash-content (mineralized) peat deposits, their genesis

and specific stratigraphy.

Peat with mineral inclusions in the form of mechanical mixtures or laminations or lenses is described with a view to its use in agriculture. These inclusions specifically noticeable in dry peat are nonuniformly distributed in peat of normal ash content. Such deposits probably were formed by the normal process or by mineral sedimentation. As result, deposition of high complexity occurs with specific stratigraphy and specific distribution of physical and agrochemical properties, which are not subject to general regularity in distribution. Four main groups of deposits are described, with alumino silicates, carbonites, iron phosphates, and with complex mineralization. Deposits of these types are usually found in southern regions and used mainly as fertilizers. Copy seen: DLC.

46773. MINNESOTA. UNIVERSITY. The Strait of Anian; an exhibit of three maps in the James Ford Bell Collection at the University of Minnesota, portraying sixteenth and eighteenth century concepts of the waterway between Asia and America, which is now known as the Bering Strait. St. Paul, Minn., North Central Pub. Co., 1956. 13 p. 3 maps (1 fold.)

Describes mapping of Bering Strait, eastern Siberia and western North America in the 16th and 18th centuries, principally the 16th century maps of Camocio and Zaltieri, which are reproduced; also Bering's expedition across Siberia and exploration of the Strait, 1725-1730, with reproduction of map showing his route. Otdel geologicheskil, t. 22, no. 1, p. 83–103, 2 text maps, diagrs., graphs.) 16 refs. Text in Russian. Summary in English. *Title tr.:* Relief and geology of loose soil on the Yenisey ridge between the Rivers Bolshoy Pit and Angara.

Contains description of the relief and stratigraphy of gold-bearing Quaternary deposits in the ancient and contemporary Yenisev and Angara valley. The younger deposits are mostly of the following types: eluvial, deluvial, solifluctional, alluvial, or deposits of contemporary seasonal freezing. On the basis of the lithology and geomorphology, three phases in development of the relief in the Yenisev ridge are discussed: formation of ancient peneplain in Mesozoic time; dissection of ancient peneplain and formation of broad valleys filled with deposits of the first complex, the remnants of which are preserved in the contemporary watersheds; and formation of now buried and also of contemporary valleys. The recognition of shifting of river systems and the existence of buried valleys, connected with late tectonic movement, opens new possibilities for the prospecting of gold Copy seen: DLC. placers.

Revised edition of No. 24382, with addition of 140 pages and many illus., presentation of new methods in concrete work, additives for quick hardening and higher strength, etc. A new chapter (p. 281-96) deals with preparation of prefabricated parts: panels, beams, columns, heavy plates, etc., with individual heating or in heated sheds. Construction of smoke stacks, silos, towers, bridge arches with movable heating arrangement is described in detail (p. 296-306). Special work under freezing conditions, with various additives and electric heating for reinforced concrete structures is outlined with illus. Methods of facing and plastering building walls are included (p. 307-Arrangements and equipment are described (p. 340-78) for concretemixing plants with a heating system.

This pine was first collected on Baranof Island, Alaska, by Mertens, a naturalist with Litke's round-the-world expedition. The collection was described by H. G. Bongard (No. 1961), who misidentified this plant as *Pinus inops* Aiton. In 1825

D. Douglas collected lodgepole pine near the Columbia River mouth in the State of Washington, and his specimen was described in 1838 by J. C. London as P. contorta n. sp. Copy seen: DA.

MIRSKY, JEANNETTE, 1903–, see Sanders, I. T. Societies around the world. 1956. No. 47782.

46787. MISENER, AUSTIN DONALD, 1911—, and others. Heat flow measurements in permafrost at Resolute Bay, Northwest Territories. (Royal Astronomical Society of Canada. Journal, Jan.—Feb. 1956. v. 50, no. 1, p. 14–24, diagrs., graphs.) 7 refs. Other authors: P. C. Bremner and J. H. Hodgson.

During summers 1950-1953, drilling operations were carried out at Resolute (74°41' N. 94°55' W.) to determine temperature gradient in bedrock. Drilling instruments and difficulties due to permafrost and caving are described. Several holes were completed ranging from a few feet to 650 feet, and temperature-measuring elements were installed. Cores were taken at 50-ft. intervals. Analysis of temperatures indicates a temperature gradient at depth of 2.16° F./100 feet. The mean thermal conductivity of the cores has been determined as  $7.3 \pm 0.7 \times 10^{-3}$  cal./cm./sec./deg. C. Combining these two measurements leads to a heat flow of 2.9 x 10<sup>-6</sup> cal./cm.<sup>2</sup>/sec. This is about twice the value hitherto accepted as normal for the sea level crust. An unexplained anomaly exists in that temperatures near the surface are higher than would be expected from the gradient at depth.-From author's abstract.

46788. MITCHELL, JOHN MURRAY, 1928 - . Strong surface winds at Big Delta, Alaska; an example of orographic influence on local weather. (U. S. Weather Bureau. Monthly weather review, Jan. 1956. v. 84, no. 1, p. 15–24, text map, graphs, diagr.) 5 refs.

The remarkably high frequency of strong surface winds in this region (64°10′ N. 145°50′ W.) is studied with respect to its cause, characteristics, and local effects. During the winter, the winds are predominantly east-southeast and, unlike glacier or valley winds, are

caused by a topographically induced convergence of the flow of air down the Tanana valley which occurs at times of southeast gradient winds aloft. Strong south winds are also experienced the year round. The east-southeast winds are persistent; in an extreme case (described) gusts in excess of 40 m. p. h. endured for 7½ days (Jan. 20-28, 1952). These winds are also characterized by marked diurnal variation in frequency of their commencement; a strong control by atmospheric tides is inferred. An important effect of the winds is to interrupt periods of very low temperature, but sometimes to create severe 'wind chill.' Brief account of the forecast problem is given.-From author's abstract. 46791. MOBERG, ARVID. Litet om handel och gränstrafik i gammal tid inom nordkalotten. Tromsø, Jan. 1955. 12 p. 2 text maps. (Ottar, nr. 2). Text in Swedish. *Title tr:* Brief account of commerce and border traffic in olden times within the Scandinavian Arctic.

Colonization of the Scandinavian arctic region after 1300 A. D. was fostered by commercial interests of Norway, Sweden, Finland, and Russia. Some 16th-17th century data are given, and the best overland routes from northern Sweden to the arctic coast are described; trade commodities (mainly cod, halibut) and volume are discussed. The role of fairs, visited by Russians as well as Scandinavians, is noted. Other important factors in trade have been the establishment of a postal service in the mid-18th century and building of a railway for transport of iron ore at the end of the 19th century. Both are described in some detail.

46797. MØLLER, JØRGEN KISBYE, 1915- . Det grønlandske retsvæsen. (Grønland 1953, hefte 11, p. 425-31, illus.) Text in Danish. *Title tr.:* The Greenland judicial system.

The judicial system before and after the passing of the Administration of Justice Act in 1951 is outlined. Main features of this law are: the establishment of a court of appeal (Grønlands landsret, the Greenland High Court), district courts (one in each commune in West Greenland), and an independent police service. Greenland courts deal with every kind of case, whether Dane or Greenlander is involved, and the Greenlandic and Danish languages have the same status in the courts. The sittings are public and the accused has the right of counsel (usually a layman). All judges in Greenland, apart from the president of the "landsret," are laymen, and 10 of 16 district judges are Greenlanders.

A study of vertical distribution of elements of organic origin, phosphorus, oxygen and silica. Columns down to over 5000 m. are analyzed from a variety of stations. Seasonal differences in the upper layer of 200 m. were also investigated and the role of vertical circulation in their distribution, assessed. Conditions are compared with those in the Pacific. Based on work of the research vessel Vitiaz' in 1950-1953, and that of other Russian and American vessels in the 1930's.

Bulletin, 1956. t. 49, no. 2, p. 254-60, table.) 22 refs. Text in French. Title tr.: New studies on the action of cold upon the trophozoites of various parasitie protozoans.

Study on the critical effects of low temperatures (-20° to -180° C.) acting for various times upon trophozoites of the species Enlamoeba, Trypanosoma, Trichomonas, etc. Both slow and rapid freezing

and rewarming were applied, and their effects are evaluated.

Copy seen: DNLM.

46808. MOLINARI, VINCENZO. Sur le comportement d'Entamoeba dysenteriae et d'E. invadens en présence de températures de -79° C. (neige carbonique) et de -180° C. (azote liquide). (Société de pathologie exotique, Paris. Bulletin, 1956. t. 49, no. 3, p. 532-40, table) 22 refs. Text in French. Title tr.: Behavior of Entamoeba dysenteriae and Envadens at temperatures of -79° C. (carbon dioxide snow) and -180° C. (liquid nitrogen).

A study of young and adult trophozoites suspended in various media, with and without addition of glycerol. Different stages of growth, having a different nuclear and cytoplasmic structure behaved differently with respect to survival after exposure to cold. Interspecific differences also explain variations in cold resistance.

Copy seen: DNLM.

46813. MOLODYKH, IVAN FEDOROVICH, 1897— . Zadachi transportnogo stroitel'stva na Severo-Vostoke Ākutii. (Irkutsk. Universitet. Biologo-geograficheskii nauchno-issledovatel'skii institut. Izvestiâ, 1931, t. 5, vyp. 4, p. 3–23, tables, fold. map.) 5 refs. Text in Russian. Title tr.: Tasks of development of transportation in northeast Yakutia.

In 1928-29, a party of engineers and scientists headed by the author and sponsored by the Waterways Administration of the U.S.S.R. and the government of the Yakut A. S. S. R., investigated the economy and transportation of Kolyma and Indirgirka River basins. The expedition's work is outlined and results are reported of its study of the geographic, hydrological, economic, and demographic conditions in relation to The area is rich in transportation. forests, fur animals, gold and other minerals; but its development is retarded by lack of transportation. Three former routes to this area (one summer, two winter) were all based on Yakutsk; prior to World War I, two new routes were tried: one by sea from Vladivostok to the Kolyma River mouth, the other from Ola (59°35' N. 151°17' E.) on the Okhotsk Seacoast by taiga trails to the upper reaches of the Kolyma and downriver to Nizhne-Kolymsk. All these routes were studied by expedition of 1928-29 and the development of a modified Okhotsk Sea route was recommended with the starting point at Nagayeva Bay (59°31' N. 150°40' E.), with the sea route Vladivostok-Kolyma to be used as a subsidiary for transportation of heavy machinery and equipment. In the subsequent foundation of Magadan on Nagaveva Bay and construction of an automobile road from Magadan to Kolyma River, this recommendation seems to be realized. Limitations of dogsled transportation due to difficulties of feeding are discussed (p. 15-16). Fold. map shows the Kolyma-Indigirka economic area with scheme of its transportation. Copy seen: DLC.

46823. MOODY, ALTON B., 1911 ... The Pfund sky compass. (International hydrographic review, Nov. 1950. v. 27, no. 2, p. 62-66).

The origin, operation, and limitations of this compass, which is particularly useful in arctic navigation, are described. The instrument utilizes the polarization of sky light to determine the sun's

azimuth even with the sun below the horizon; it is thus useful during polar twilight. The device which originated with Dr. A. H. Pfund at Johns Hopkins University, in 1944, was developed by the U. S. Bureau of Standards after the war and the compass was tested and proven satisfactory by the U. S. Air Force Ptarmigan flights from Fairbanks to the North Pole.

46824. MOODY, ALTON B., 1911—. Recent developments in polar navigation. (International hydrographic review, Nov. 1950. v. 27, no. 2, p. 67-69.)

Problems of polar aerial navigation and recent improvements in techniques and equipment designed to improve navigation are discussed briefly. Determination of direction is the principal problem. Directional gyros, and during twilight the use of the Pfund sky compass, have solved this problem to a great extent. Present charts of polar areas are adequate for celestial navigation in the Arctic.

Copy seen: DLC.

46825. MOON, A. E. The removal of frost and ice from sunshine spheres. (Weather, May 1956. v. 11, no. 5, p. 168.)

Contains a brief description of various methods for removing frost and ice from the surface of Campbell-Stokes sunshine recorders. The most successful method appears to be to pour about a teaspoonful of alcohol over the top of the sphere in situ and allow it to run completely over the deposit.

Contains results of detailed field studies 1944-1951, to assist in exploration of gold deposits, in the area  $63^{\circ}56'-64^{\circ}19'$  N. 111°00'-30' W., 150 miles northeast of Yellowknife. All consolidated are Precambrian (probably Archean), except for some diabase dikes. Oldest are lava flows conformably overlain by sedimentary rocks, both of the Yellowknife group. Strata have been closely folded and invaded by granodioritic and dioritic Large areas have been meta-Strata have also been morphosed. intruded by meta-gabbro sills and masses of felsic porphyries. Diabase and gabbro dikes, youngest consolidated rocks, are probably Proterozoic. Gold deposits occur at intervals along the strike of the contact of the volcanic and sedimentary The quartz occurs as fairly rocks. persistent veins and as veinlets and lenses in shear zones. Gold deposits owned by the various mining companies are described; also, very briefly, copper and molybdenum occurrences.

Map (scale 1 in.: 1/2 mi.) covers the area 55°00'-20' N. 95°30'-45' W. Field mapping was done in summer 1953. Means of access, physical features are described. All consolidated rocks are Precambrian. Oldest are two belts of metamorphosed sediments and volcanics. andesites and basalts being dominant. Age relations of the granitic rocks which underlie most of the area are not clearly established. A diabase dike, crosses the northern map-area. Glacial deposits, swamps and muskegs mantle the area, bedrock outcrops are few. Small-scale faulting is common, and three major faults were mapped in southern volcanicsedimentary belt. No promising mineralized areas were seen.

46841. MORGAN, JOSEPH M. Water power resource investigations in Alaska. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 21.)

Sites investigated by the Bureau of Reclamation include Eklutna, Swan Lake, Dorothy Lake, Blue Lake, and the entire Susitna River. It is planned to construct a concrete arch dam 156 ft. high for the Swan Lake project 22 miles northeast of Ketchikan. The Blue Lake project near Sitka would consist of a concrete arch dam 240 ft. high above stream bed, creating a reservoir of approx. 300,000 acre ft. Copy seen: DGS.

46842. MORGAN, JULIET, and E. L. KEITHAHN. Alaska and Hawaii. New York, Macmillan, 1956. 312 p. illus., text maps. (Around the world; a series of geography readers.)

A textbook for children which includes (p. 10–139) a survey of Alaska, includes incation, physical geography, government, native population, discovery and exploration, the Gold Rush and present gold mining, transportation facilities, Eskimo and Indian living conditions and customs, agriculture, cites.

Copy seen: DLC.

46843. MORGAN, ROBERT. World sea fisheries. London, Methuen, 1956.

14, 307 p. illus. tables, maps. Approx. 130 refs.

A concise and informative survey of sea fisheries of major areas, their relative importance, and basic reasons for their varying character. Section 1 (p. 3-62) deals with physical and biological factors affecting fisheries; plankton; coastal fishing areas; economically important sea fish; world production and potential. Section 2 (p. 65-152) covers fishing methods, etc. including processing, transport, harbors, etc. In section 3 (p. 155-292) the fishing industry is presented according to continental regions; arctic fisheries, consequently, are treated under the Asian, European and North American regions, as well as in scattered references throughout the first two sections. southern whaling regions are dealt with (p. 279-83); changing aspects of fisheries are noted: in conservation, fish-farming, technical devices, etc. Appended are tabular data of recent catches of countries producing over 5,000 tons, including several wth arctic fishing grounds.

46845. MORI, GENJI. Studies on the cold preservation of blood; especially on the changes of erythrocytes stored in the supercooled state. (Teion kagaku, Low temperature science, Sapporo, 1956. v. 14, ser. B., p. 47–73, illus., table.) 48 refs. Text in Japanese. Summary in English.

\* Account of investigation on human, bovine, dog and rabbit blood preserved in citrate, ACD and EDTA solutions at temperatures of +5° C. and —5° C. Tests were applied at weekly intervals during a storage period of 5–6 weeks. Decrease in number of red cells, hemolysis, osmotic fragility, cell volume and pH at both temperatures were determined and compared. As viewed from the standpoint of hemolysis, a storage temperature of +5° C. proved more advantageous for human and bovine blood, less so for that of the dog and rabbit. \*\*Copy seen: DLC.

Popular sketches of recent Soviet arctic exploration by a journalist who has participated in several arctic undertakings since 1937, among them the reconnaissance flight along the Northern Sea Route from Arkhangel'sk to Bering Strait in 1947, the high latitude flights in 1948 and 1949, the setting up of the drifting stations "North Pole"-2, -3, and -4. Several arctic flyers are characterized: Babushkin, Vodop'anov, Titlov, Cherevichnyl, Kozlov, etc. Difficulties in landing and take-off in arctic conditions are indicated. Polar stations and harbors of the Northern Sea Route are noted. Organization of drifting stations, expedition leaders, station personnel, their living conditions, etc., are outlined. Meteorological, aerological, bathymetric, geomagnetic explorations are sketched. Discovery of the submarine Lomonosov Range, discovery and origin of ice islands, new bathymetric map of the Arctic Basin, etc., are discussed. In the preface (p. 3-6), Academician D. I. Shcherbakov warmly recommends the book, which is extensively illustrated with photographs. Copy seen: DLC.

MOSS, EGIL, see Faegri, K., and E. Moss. On the occurrence . . . Codium . . . Scandinavian coasts. 1952. No. 44842.

46872. MOTT, PETER G. Air survey of the Falkland Islands Dependencies, 1955–1956. (Polar record, Sept. 1956. v. 8, no. 54, p. 237–45, 2 illus.)

The survey was made by means of air photography and ground control. Extremely poor weather conditions limited air operations. The natural hazards to flight in polar regions necessitate special precautions which reduce the theoretical air coverage because of practical limitations on equipment and personnel. Snow covered surfaces, particularly along the coast line, result in special problems to the air photographer of exposure and development. The only solution for snow-covered coast lines is photographing the area twice, once for the snow and once for the rocks. Empty 44-gal. fuel drums were utilized for marker beacons. Painted red and placed in a solid circle 10 ft. in diameter and 3 ft. high, the markers show clearly on vertical photographs at 1/30,000 scale. The party's base and equipment including moorings for aircraft, boats, etc., are described. Copy seen: DLC.

46873. MOULDER, PETER V., and R. G. THOMPSON. Protection of heart under hypothermia arrest. (Society for Experimental Biology and Medicine. Proceedings, May 1956. v. 92, no. 1, p. 49–52, illus. table) 7 refs.

Account of experiments with dogs made hypothermic to 24°-27° C. It was found that intracoronary acetylcholine decreases profoundly the rate of the occluded heart; this action was quite prolonged during hypothermia but intracoronary atropine reversed it. The protective value of

cardiac slowing during circulatory occlusion, is discussed. Copy seen: DLC.

46874. MOVIUS, HALLAM LEONARD, 1907— . Late Pleistocene (4th Glacial) conditions and Palaeolithic settlement in Soviet Central Asia and western Siberia. (In: International Quaternary Association. 4th Conference, Rome, 1953. Actes, pub. 1956. Pt. II, p. 711–28, text map, table.) 85 refs.

Includes (p. 720-24) description of the West Siberian Lowland extending from the Ural Mts. east to the Yenisey and north to the Arctic Ocean, with a review of the literature concerning extent of Late Pleistocene glaciation. At least two glacial stages have been recognized, correlated with the Riss and Würm of Western Europe. During the last glaciation, drainage in the Ob' and Irtysh Rivers was blocked, forming shallow lakes and swamps, around which extensive loess deposits accumulated. Although areas were favorable for Upper Paleolithic hunters, no large camp sites have been Reconstruction of paleogeographic conditions must be tentative, as almost no intensive geologic mapping has been done. Copy seen: DGS.

46875. MOXHAM, ROBERT MORGAN, 1919—, and R. A. ECKHART. Marl deposits in the Knik Arm area, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. 23 p. illus., 7 maps (1 fold.), sections, 4 tables. (U. S. Geological Survey. Bulletin 1039–A. Investigations of construction materials in Alaska.) 14 refs.

Contains results of investigations in July 1951 in this area north of Anchorage and west of Palmer (61°16' N. 149°54' W.). Geology of the region is outlined. Marl occurs in and adjacent to at least five lakes, most significant deposits being near Wasilla. Accumulation of the calcareous material has taken place in sheltered embayments and shallow marginal areas of the lakes. In some places embayments filled with marl, then covered by muskeg, have deposits sealed off from the lake proper. Some 50 species and varieties of diatoms (listed) were collected from the marl. Deposits, probably chemically suitable for manufacture of portland cement, are too small (reserves approx. one million tons dry weight.) for large-scale operations. Suggestions are made for future exploration.

Copy seen: DGS.

46876. MOYER, JOHN H., and others. Renal functional response to hypothermia and ischemia in man and dog. (In: National Research Council. Division of Medical Science. The physiology of induced hypothermia . . . symposium, Oct. 1955, pub. 1956. p. 199-213, illus. tables) 2 refs. Other authors: G. C. Morris and M. E. De Bakey.

Account of experiments with dogs and observations on four patients, the latter cooled to about 80° F. the former to 90° and 80° F. The effect of hypothermia upon the kidney, renal damage produced by ischemia, and the protective effect of lowered temperature against this damage, were the main problems studied. Renal functional response was found to be similar in both groups consisting in moderate depression of renal blood flow and glomerular filtration. Hypothermia did not protect against injury or prolonged ischemia.

46877. MOZEL', I. M. Kachestvennaı kharakteristika apatitovol produktsii Khibinskikh tundr. (In: Khibinskie apatity, 1933. t. 6, p. 36–42, graph, table.) Text in Russian. Title tr.: Qualitative characteristics of apatite production in the Khibiny tundras.

Basic characteristics of production are defined by phosphoric anhydride (P<sub>2</sub>O<sub>b</sub>) content of the apatite ore. Quality of production was improved by better initial sorting of ore and allocation of ores of different concentration for different purposes: quality for the metallurgical industry varied from 28.7 to 34.6 percent. Quality of flotation apatite concentrate of the superphosphate type was 39.5 percent. Variations in quality of product are illustrated in graph and table.

Copy seen: DGS.

46878. MOZEL', I. M. Raboty TSentral'noï khimieheskoï laboratorii Tresta Apatit. (*In*: Khibinskie apatity, 1933. t. 6, p. 275–78.) Text in Russian. *Title tr.*: Work of the Central Chemical Laboratory of the Apatite Trust.

Contains brief review of the laboratory work, particularly crushing and separation of ore concentrate, and evaluation of error in analyses of rare earths. Remedies are recommended.

Copy seen: DGS.

Trudy, 1956. t. 8, p. 51-76, 4 tables) Text in Russian. Other authors: K. M. Ryzhikov, V. E. Sudarikov and E. S. Lefkina. Title tr.: Activities of 290th Union Helminthological Expedition of 1953 in the Yakut A. S. S. R.

Contains brief outline of this ten-man expedition headed by the senior author to study helminthiasis of man and of game and fur-bearing animals. Incidence of infection was found higher among native than Russian population. The intensity of infection seemed to depend primarily upon age, children being affected the least, and adults over 50 yrs. the most, and upon food (meat or fish). Results of the medical party's investigations are tabulated (tables 1-3). The biological party investigated 1290 animals: 326 fishes, 32 amphibians and reptiles, 436 birds and 496 mammals. The results are discussed and tabulated: 150 species are listed with number of specimens studied, and the extent (percent) of infection by nematodes, cestodes and trematodes. Copy seen: DLC.

Assen, Van Gorcum & Comp. N. V., [1951]. 123 p., 34 diagrs., 5 tables, map. (Amsterdam. Universiteit. Geologisch Instituut, Mededeling no. 175.) 43 refs. Text in English. Summary in Dutch.

This region, 65°50′-66°04′ N., 15°0′-15°25′ E., in the Swedish Caledonide mountains, is bounded on the north by the Gabbi-Mesket region reported on by Aleva, q. v. Its highest elevation is about 1400 m., and it has some small permanent snowfields. Variations in elevation are due largely to differences in rock resistance. Glacial activity has left

a variety of features, including morainal and fluvio-glacial deposits, and an example of "kursu" valleys described by Rudberg, q. v. Mulder treats the geology, petrography, petrology, stratigraphy, and tectonics that are responsible for the rock series. In the closing chapter on geological evolution, he summarizes the nature and sequence of events concerned in the bedrock history. Reviewed by Gunnar Kautsky, in Geologiska föreningen, Stockholm, Förhandlingar, 1951, bd. 73, häfte 3, no. 466, p. 521.

Map (scale 1 in.: 4 mi.) covers the area 60°-61° N. 109°-110° W., northwest of Uranium City and the Beaverlodge area of northern Saskatchewan; it includes basins of Hill Island Lake, Tazin, and Thoa Rivers. Canoe routes are Rocky hills and ridges occupy noted. much of the area, but glacial deposits are common, especially in the northeast. Bedrock is all Precambrian. Much of the map-area is underlain by a mixed assemblage of granitic and metamorphic rocks. Older quartzites and conglomerates and younger granites and diabase dikes are also described. No mineral deposits of any importance were found.

Outline and appreciation of the Statute for Administration of the Native Peoples (Ustav ob upravlenii inorodtsev) drawn up by M. M. Speranskil during his governor-generalship in Siberia 1819-21; the statute, in force from 1822 till 1917, was based on a division of Siberian natives into three groups: settled, migrating and nomad, and on partial recognition of the native tribal organization, customs and laws; its main purpose was to regulate the levy of "îasak" (a kind of tribute) and taxes. Difficulties of enforcing the statute and its inequities are noted. The codification of native customs, envisaged by the statute but never completed, is described, and the ethnographic importance of information collected in the process is stressed. This paper based on published and unpublished material, was presented to the Northern Conference at Leningrad University, Dec. 10-14, 1947. Copy seen: DLC.

posit in Greenland.

Note on the lead-zinc deposit at Mesters Vig, northeast Greenland (72°09′ N., 23°45′ W.), discovered in 1948. Exploratory work has indicated over one million tons of high-grade lead ore. In 1952, the mining company Nordisk Mineselskab received a 50-yr. concession on all mines along the East Greenland coast, 70°-73° N., its financial assets are noted. Mining will start in spring 1956 and first shipment of mineral concentrate is expected by late 1956. Mining village for 150-200 workers has been established. Copy seen: DGS.

46914. MUTTIT, G H. Some aspects of ceilings and visibilities in snow at Goose Bay, Lab. Toronto, May 1956. 8 p. 2 graphs, 3 tables. Mimeographed. (Canada. Meteorological Service. Circular 2781, TEC-232.) 2 refs.

Study to determine chances of getting fairly low conditions when snow occurs, also relationship between horizontal and vertical visibilities. Tables show, according to various visibility classes, distribution of: ceilings, cloud and snow ceilings in snow situations, and snow ceilings on basis of data for 1945-1953. Frequency of ceilings 0-4000 ft., with visibilities 0-4 mi. at Goose Bay 1945-1953 is graphed. Results showed that "if a system approaching Goose Bay is expected to give snow it is almost certain to produce ceilings below 1000 ft. and visibility less than 1 mi. for a good part of the period during which the snow falls."

,

d

Discusses glaciation of the central and northwestern Siberian regions: Taymyr, Ob' and Yugan (61° N. 73° E.) basins. Two regional divisions are set up: glacier center (elevated areas of earlier glaciation) and glacier periphery (lower plains of later active glaciation, to which ice, rocks, and other materials have been moved). The latter division is discussed as to stages of the glacier movement: (1) accumulation of stationary firn ice (embryonic glaciation), later covered by active ice, flowing from the center; (2) stabilization of cover; and (3) disintegration by erosion, flowing, thawing and by other physical processes. Graphical illustration of these stages is given on p. 646. This multiple process of the glaciation is also confirmed by the studies of I. P. Gerasimov and K. K. Markov.

46924. NAGINSKIĬ, N. A. O mekhanizme rosta chetvertichnykh lednikovykh pokrovov Zapadno-Sibirskoi nizmennosti. (Akademiña nauk SSSR. Doklady, July 21, 1953, nov. ser., t. 91, no. 3, p. 625–28, diagr.) 3 refs. Text in Russian. Title tr: Process of growth of Quaternary glacier cover of the West Siberian plain.

The movement of glacier ice and its erosive action are analyzed on the basis of studies on moraine and submoraine deposits on the M. Yugan River (61° N. 73° E.) in W. Siberia. The relative magnitude of these deposits indicates the process of growth of glacier cover and velocity of its spreading over lakes and rivers. A new type of continental glaciation is found in Eastern Siberia, the embryonic or Yakutian type, which is characterized by accumulation of firn over large areas of completely frozen lakes, as diagramatically illustrated on p. 627. Glacier observations in the Alps and Greenland are used to determine the depth at which the laminar movement of ice is changed to extrusion flow.—From SIPRE. Copy seen: DLC.

46925. NAGINSKIĬ, N. A. Oblasti razvevaniâ chetvertichnykh lednikovykh pokrovov Zapadno-Sibirskoĭ nizmennosti. (Akademiâ nauk SSSR. Doklady, July 11, 1953. nov. ser., t. 91, no. 2, p. 375–78, map, illus.) 6 refs. Text in Russian. Title tr: Region of scattering of the Quaternary glacier cover in the West Siberian plain.

Significance of wind action during glaciation and the deposition of windborne materials through different regions of West Siberia (Ob', Pur, Nadym River basins) and the Urals is discussed on the basis of collection of boulders, pebbles, sand and clay (illus. p. 377). Strong wind carried these materials even to upper levels. The areas of scattered material are shown on map. **Copy seen:** DLC.

46926. NAGINSKIÍ, N. A. Vzglifady akademika V. A. Obrucheva na istorifu oledenenifa Zapadno-Sibirskof nizmennosti v svete obshchikh voprosov dinamiki lednikovykh porkrovov. (Akademifa nauk SSSR. Komissifa po izuchenifu chetvertichnogo perioda. Bfulleten', 1953. no. 19, p. 23–37, maps) 9 refs. Text in Russian. Title tr: Academician V. A. Obruchev's views on the history of glaciation of the West Siberian plain in the light of the general problems of dynamics of the glacial covers.

The view advanced by Obruchev's Priznaki lednikovogo perioda v Severnoš i TSentral'not Azii (Signs of the ice age in northern and central Asia) 1931, on the existence of glaciation in northern Siberia has been supported by later investigations. The problem of the centers of glaciation in the Ural, Taymyr and Yamal-Taz land (now submerged), of the glaciers' advance, their extension and boundaries at the peak of glaciation, retreat of the ice cover and its gradual disappearance, have been studied by Obruchev and others. The present status of the problem is summarized and the interaction of Siberian cover of glaciation with that of Ural is discussed.

The composition, changes in shape, and properties of Tyndall and vapor figures were investigated. The plane of the Tyndall figure is always perpendicular to the C-axis and the direction of the branches coincides with the A-axis. side of the hexagonal vapor figure coincides with the direction of the branches of the Tyndall figure. Once internal melting has taken place, the crystalline structure is disturbed upon refreezing and the fine layer structure is revealed. Vapor figures were found to migrate and change in shape when a thermal gradient was applied across the sample. The experimental values for the migration velocity agree with the theoretical values. The deformation of the vapor figure under isothermal conditions was investigated. Photomicrographs of ice crystal figures are appended. Copy seen: CaMAI.

46934. NARDONE, ROLAND MARIO, 1928 - . Some aspects of the ecology and tissue chemistry of the arctic blackfish, Dallia pectoralis. Washington, D. C., Catholic University of America, 1956. 25 l. 4 plates, tables. 25 refs.

Report on work conducted in late July and mid-August, 1955 at lakes (two), polygon ditches, and tundra pools in Northern Alaska near 70°46′ N. 155° W. and at the Arctic Research Laboratory at Point Barrow 60 miles to the northwest. Ecological studies included pH, temperature, oxygen content of the water, and feeding characteristics of the fish. Physiological studies included lipid and glucose content of liver, brain, and muscle, and length-weight relationships. pH of the water ranged from 6.8 to 8.0. Water temperature varied from 7.8° to 13.2° C. Dissolved oxygen varied from 2.30 to 12.58 ppm. Ostracoderms and Cladocera were the principle food organisms, numerically. The tissue glucose of specimens kept at 25° C. was lower than that of cold-exposed specimens. The lipid phosphorous level of all tissues was low. The total lipid level of brain was high while the cholesterol level of that tissue was low. The lipid pattern of Dallia pectoralis showed wide variation. Copy seen: CaMAI.

Industrial development of Siberia which produces 80 percent of the Soviet Union's hydro-electric power on the Angara, Yenisey, and other rivers, and which is the metallurgical base of an annual production of ca. 20 million tons of cast-iron, is briefly outlined. In addition to 75 percent of the available coal deposits, it has vast forest reserves to be used for industrial purposes. In view of rapid growth of industrial life of Siberia the problem of forest control and preservation is considered of the first importance. Prevention of large forest fires and destruction by insects and pests (parasites) require not only experienced direction and personnel but also forestry high schools and colleges. The problems of specialized training and research are included in the general plan for development of Siberia. Copy seen: DLC.

46943. NATIONAL RESEARCH COUNCIL OF CANADA. ASSOCIATE COMMITTEE ON SOIL AND SNOW MECHANICS. Proceedings of the Eastern Muskeg Research Meeting, February 22, 1956. Ottawa, Oct. 1956. 64, 4 p., 2 text maps, diagrs., cross-sections, tables. (Its: Technical memorandum, no. 42.) 7 refs.

Record of Second Annual Muskeg Research Meeting, the first in eastern Canada. Progress reports were given on work of the newly-formed Special Committee on Muskeg of the Canadian Petroleum Association, by J. P. Walsh (p. 41–44); on muskeg research at the National Research Council, by I. C. MacFarlane

(p. 58-62); and at McMaster University, by N. W. Radforth (p. 62, title only). Those attending are listed with affiliations. Papers presented and discussed at the technical sessions (except that by A. Lafond) are listed in this Bibliography under the authors' names, viz:

MacFARLANE, I. C. Techniques of road construction over organic terrain.

HARDY, R. M., and S. THOMSON. Measurement of the shearing strength of muskeg.

RADFORTH, N. W. The application of aerial survey over organic terrain. HEMSTOCK, R. A. Economic aspects

of muskeg with respect to oil production. Lafond, A. Muskeg as it affects the economies of the forestry industry in Quebec, p. 45 (title only).

**46945.** NATURE. Défense et exploitation de l'eider. (Nature, Paris, June 1956. no. 3254, p. 223, 2 illus.) Text in French. Title tr.: Protection and exploitation of the eider.

Note on the reservation on islands in Kandalaksha Bay of the White Sea, where the eider duck is protected and a Soviet research station has been established; qualities of eiderdown, times of collection, etc. Copy seen: DLC.

46946. NATUREN. Vitenskapelig feltarbeid i Norge 1956. (Naturen, Bergen, 1956. årg. 80, nr. 5, p. 275–88.) Text in Norwegian. Title tr.: Scientific field work in Norway 1956.

Scientific organizations and the field studies they sponsored in 1956 are listed, 38 of them in arctic or adjacent areas. They included fisheries, limnology, mapping, gravimetric and geodetic work, geological, archeological and botanical investigations. The Norsk Polarinstitutt directed a variety of studies (ten in all) in Syalbard and Greenland; the Tromsø Museum, eight in northern Norway; various other, Norwegian and foreign, government and private organizations sponsored their own subjects.

NAUMOVICH V. M. Kach-46956. estvennafa kharakteristika frezernogo torfa, poluchennogo iz promorozhennol torfomassy. (Akademifa navuk BSSR. Minsk. Instytut Sbornik torfa. nauchnykh trudov, 1951. vpy. 1, p. 64-77, illus., tables, graphs.) 6 refs. Text in Russian. Title tr.: Qualitative characteristic of the peat milled from frozen raw mass.

Frost effect on the raw peat mass is experimentally determined by analysis and testing of three types of samples: of milled frozen mass, milled non-frozen mass, and raw peat mass (non-milled). The frost effects on peat characteristics are tabulated and graphed. The quality of frozen raw peat is generally reduced, due to fusion of small cells during freezing or to coagulation of the dispersed system of cells and rupture of the structural units (cf. fig. 5-7). The quality of frozen peat is not affected if its moisture is reduced below 50 percent. Also, mechanical crushing or milling after thawing eliminates any detrimental effect of freezing. Copy seen: DLC.

46958. NAUTICAL MAGAZINE. Anomalous propagation in radar. (Nautical magazine, June 1956. v. 175, p. 350–52.) Pub. also in International hydrographic review, Nov. 1956. v. 33, no. 2, p. 119–21.

Several instances are noted of nondetection of nearby objects at sea due to sub-refraction of the radar signal. This condition is particularly prevalent where the air temperature is much below that of the sea. A pocket of sub-refraction may develop in the vicinity of icebergs which makes detection by radar unreliable in some cases. **Copy seen:** DLC.

46959. NAVAL AVIATION NEWS. Ice floes ahead! Ships and supplies get through to arctic outposts guided by ice forecasts put out by U. S. Navy Hydrographic Office. (Naval aviation news, Oct. 1956. 37th year, p. 1–5, illus., 2 text maps.)

The development of aerial ice reconnaissance and forecasting techniques in the Arctic since 1950 is examined. Forecasting sea ice conditions is the responsibility of the Hydrographic Office. The program has developed to the point where complete briefings on current ice conditions can be supplied together with both short- and long-range forecasts, with a considerable saving in supply operations by ship to this area.

Copy seen: DLC.

**46960.** NAVAL AVIATION NEWS. Soviet polar operations in the Arctic. (Naval aviation news, Mar. 1956. p. 20–23, illus.)

A series of 17 photographs is presented depicting life and operations on Soviet floating ice stations in the Arctic. Transport planes and helicopters are shown.

\*Copy seen: DLC.\*

46961. NAVAL AVIATION NEWS.
Take the bite out of frostbite. (Naval

aviation news, Dec. 1956. 38th year, p. 1-5. illus.)

The development of new equipment and techniques for naval air operations in cold areas is described briefly. Starting of aircraft in cold weather, ice removal from aircraft, cold weather clothing, and snow removal from airfields are discussed.

Cooling the dog's body was found to cause a temporary suppression of urine flow in the intact kidney, but not in the denervated one. In the rabbit, chilling led to a decrease in number of blood vessels and glomeruli (mainly in the cortical part) of the intact kidney; in the denervated organ no such change was noted. The possible mechanism of these phenomena is discussed.

207, 7 tables.) 10 refs.

Account of recent findings (cf. No. 21646) from banding operations of key species in highly productive nesting grounds. Aims and benefits of banding are stated. The activities initiated in 1948 are recounted, and the findings (through the 1952 season) are discussed with regard to movements, losses, including mortality from hunting, etc. Data refer to several ducks, geese, a swan, loon, other birds.

Animals given 400 x normal doses of the vitamin, showed reduced food intake and weight, skeletal fractures and hemorrhages. A negative balance for calcium, phosphorus and nitrogen set in and continued long after cessation of excessive vitamin administration. No changes in the Ca and inorganic P were found in the blood and very little change in the relative mineral composition of the bones. Estimation of vitamin A in the liver, suggested its reduced absorption from the intestine.

**47002. NEWS OF NORWAY.** [News notes]. (News of Norway, 1956. v. 13.)

Current events and topics of arctic interest through 1956 include the following: Scandinavian Airlines System has ordered DC-8 jet airliners for 1960 which are expected to cut Los Angeles-Scandinavia trans-arctic flight time to 11 hrs. and 15 min.; SAS is negotiating for five powerful air-ground radio stations in North Norway, Svalbard, North Greenland, Banks Island, and North Alaska (no. 1, p. 1-2); New SAS arctic route Copenhagen-Tokyo will be opened early in 1957 (no. 42, p. 167); Studies on Arctic-Norwegian cod by the Norwegian Fishery Directorate's Ocean Research Institute show that cod and haddock move mostly in upper levels of the sea, a radical change in Norwegian fishing methods is suggested; decline in catch of mature cod at Lofoten is associated with heavy international trawling in Barents Sea, feeding ground of young cod (no. 32, p. 127); pelagic purse-seining for cod was tested on West Greenland banks by the Norwegian fishing vessel Longva, summer 1956 (no. 28, p. 110); Recommended increase (50 percent) in U. S. duty on ground fish fillets would have grave consequences in North Norway where U. S. export is crucial to the filleting industry (no. 38, p. 149); Four Norwegian sealers were beset in East Greenland pack ice in Apr. 1956; loss of life in ice of these regions in 1952, 1917, 1777 is noted (no. 15, p. 57-58); Extension of telephone and teletype communications to Finnmark will be completed at end of 1957 with construction of "microlink" relay stations from South Norway to Kirkenes (no. 8, p. 29-30; no. 20, p. 77); Consideration by Norwegian Parliament of bill for establishment of new radar air warning stations in Trøndelag and Bodø districts, extending the Tropospheric Scatter System from Turkey through Europe to North Norway (no. 20, p. 77); As part of its contribution to the International Geophysical Year, Norway is providing two radiosonde stations, on Bjørnøya (now in operation) and at Isfjord, on Vestspitsbergen (for 1957), and three radio-echo stations, at Vestspitsbergen, Tromsø and Kjeller (no. 6, p. 23; no. 32, p. 126, no. 41, p. 163); Round-the-world flight across both Poles is projected in Nov. 1956 by Swedish and Norwegian geophysicists, to record cosmic radiation at high altitudes (no. 25, p. 99); Road from Honningsvåg to Nordkap, opened July 1, 1956, is connected by ferry with the Arctic Highway which runs south 1300 miles to Oslo (no. 10, p. 38, no. 26, p. 101); Decision by board of North Norway Development Fund to invest Kr. 3 million in construction of 3,380 ft. steel and concrete drawbridge between Tromsø and the mainland (no. 35, p. 138); Norway's traveling State Gallery consisting of paintings, graphic works and sculpture will tour 15 towns and rural centers in Finnmark in late 1956 (no. 28, p. 110); Norsk Dokumentarfilm with U. S. cooperation is producing a fulllength color documentary "People of the Arctic," intended to demonstrate strategic importance of the region and show Norwegian-American cooperation in research projects (no. 36, p. 142); Development of A/S Sydvaranger of Kirkenes, Finnmark, only company in world to mine magnetic taconite on commercial scale, is traced through two world wars to its 50th anniversary in 1956 (no. 5, p. 19; no. 30, p. 118); New iron ore docks at Narvik, North Norway, built by Swedish company Luossavaara Kiirunavaara A/B and believed to be world's largest and most modern, will enable 12-15 million tons of ore to be shipped from the Kiruna district of Sweden (no. 31, p. 122); Store Norske Spitsbergen Kulkompani A/S hopes to ship 360,000 tons of coal in 1956 from Longvearbyen Preparations are being made to resume full-scale operations at Ny-Alesund mine, operated by another company, where workable deposits of 10 million tons are estimated (no. 18, p. 71); Storms in North Norway in Jan. 1956 caused property damage of Kr. 4 million to the Lofoten-Vesterålen region alone, damage to the North Norway railway will take three months to repair (no. 3. p. 10); Tests are being conducted by Oslo University's Zoo-Physiological Institute to ascertain possible changes in human body functions under prolonged exposure to low temperatures (no. 36, p. 141-42); Meeting on the economic, social and cultural problems of the Lapps in Norway, Sweden and Finland, was held in Oslo, early 1956; in Aug., conference at Karasjokk established a joint Nordic Lapp Council with a majority of Lapp members. Present conditions and future of Lapps are briefly discussed (no. 3, p. 10; no. 30, p. 119).

47004. NEZDĪŪROV, DMITRIĬ FILIP-POVICH. Inspektsifā meteorologicheskoĭ seti. Leningrad, Gidrometeorologiches-koe izd-vo, 1955. 316 p., illus., fold. maps, tables, 29 refs. Text in Russian. Title tr.: Inspection of the meteorological network.

Textbook approved by Ministry of Higher Education of the U. S. S. R. for hydro-meteorological institutes and state universities.

Methods and procedures for organization and inspection of meteorological stations and posts are described. Procedure is outlined for examination, adjustment and repair of basic meteorological instruments used for observation and recording of aerological, actinometric and agrometeorological data. Selection of station site, arrangement of instruments and laboratory equipment, etc., are explained (p. 18-75). Methods of measuring precipitation (rain and snow), icing, glazing, rate of snow melting, etc., are given (p. 135-54). Ground temperature measurement, particularly depth of frozen ground ("freezometer") is outlined (p. 186-99). Attention is given also (p. 210-48) to aerological, actinometric and agrometeorological observations including frost forecasting.

47006. NIAZI, SUAD A., and F. J. LEWIS. Profound hypothermia in the dog. (Surgery, gynecology & obstetrics, Jan. 1956. v. 102, no. 1, p. 98–106, illus.) 5 refs.

Contains descriptions of procedures which enable to cool dogs below 10° C. with survival; and to arrest (in other animals) circulation for periods of 30 minutes and to perform successfully right ventriculotomy at 18° C. Most of the dogs chilled below 10° C. had cardiac standstill for more than one hour. An important part of the technique which reduces ventricular fibrillation is the use of CO2 in the respiratory mixture and the production of cardiac standstill by shifting the hydrogen concentration of the blood to an alcaline level below 20° C. Changes of blood chemicals and hydrogenion concentration occurring during the various stages of hypothermia are also described. Copy seen: DLC.

Phosphorus metabolism of the adrenal gland of the rat; effect of exposure to a cold environment for eight days on the amounts and P<sup>32</sup>-labelling of phospholipid and ribonucleic acid. (Canadian journal of biochemistry and physiology, May 1956. v. 34, no. 3, p. 543–53, illus. tables.) 16 refs. Other authors: F. C. Heagy and R. J. Rossiter.

"In the cold-exposed animals, there was a decrease in the specific activity of both the lipid P and the ribonucleotide P" in general and relative to that of the inorganic P of the adrenal. Increase in the amounts of lipid P, RNA, DNA of the adrenals during cold exposure and changes in the ratios of these substances are also considered. Copy seen: DLC.

47010. NICHOLS, DONALD RAY-MOND, 1927—. Permafrost and ground-water conditions in the Glennallen area, Alaska. Washington, D. C., Jan. 1956. 14 p. fold. map, fold. sections, 2 tables. Mimeographed. (U. S. Geological Survey. Reports, open file series, no. 392.) 14 refs.

Study was prepared to aid construction at the junction of the Glenn and Richardson Highways (approx. 62°05'-10' N. 145°29'-31' W.), southeastern Copper River basin. Physical geography is described. The region is underlain by unconsolidated Quaternary and Recent deposits. Ground water, available at 300-400 ft. depth, is high in dissolved solids, extremely hard, and generally confined under artesian pressure beneath glacial clays and/or permafrost. Moose Creek and Dry Creek flood plains may yield potable water at approx. 200 ft. Permafrost averages -0.5° C. to -2.0° C., extends from near surface to 150-250 ft., and has moderate to high ice content. The area is characterized by fine-grained deposits highly susceptible to frost action, and by very poor surface and subsurface drainage. Construction problems are discussed. Tables present chemical analyses of ground water and data on ground conditions.

47011. NICHOLS, ROBERT LESLIE, 1904 - . Geomorphology of the southwest Inglefield Land. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 151–208, illus., diagrs.) 18 refs.

The results are reported of geomorphological studies conducted July 20-Aug. 12 in the southwest part of Inglefield Land between 78°00' N. and 79°30' N., and in the drainage basin of the Main River (which flows to the northwest along the edge of the icecap and then to the north to Rensselaer Bay). The current processes, surface deposits, geomorphic features, and evidences of past glaciation are described. Frost action phenomena observed included: non-sorted circles and polygons on till plains and in solifluction material; sorted circles, polygons, and stone stripes; vegetation-covered frost mounds more than 1 ft. high and 2 ft. in diam, at the base, in loess; intersecting frost cracks more than 3 ft. wide and 2 ft. deep forming polygons more than 100 ft. across on horizontal terrain and slopes up to 15°-20°; and debris-capped blocks, the formation of which is attributable to solifluction lobes overrunning the blocks. The depth of permafrost, measured at 3 points less than 0.5 mi. apart, was 18 in., 22 in., and 30 in. Evidence that Inglefield Land was entirely glaciated was found in the presence of sandstone erratics and rock-basin lakes about 1-5 mi. from Rensselaer Bay. The possible causes for the complete deglaciation of Inglefield Land and the presence of ice in surrounding areas are discussed. An outline of geomorphic history is included, and 20 photographs depicting various geomorphic features are presented.—From SIPRE. Copy seen: CaMAI.

47012. NICHOLS, ROBERT LESLIE, 1904 - Military significance of geologic studies in Inglefield Land. (*In:* U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, *pub.* 1954. p. 145–50, 3 maps.)

"Accesses to the icecap, trafficability conditions, water supply, landing sites, and the availability of construction materials in the area are discussed. The presence of extensive beaches and a delta

make landings in small boats possible in the Rensselaer Bay. The period in summer when these are possible is shorter than at Thule due to more numerous icebergs and thicker sea ice. Access from the icecap to Inglefield Land is possible for both men and equipment along most of the ice margin except at a few points due to ice-dammed lakes, marginal streams, and ice cliffs. During most of the year, the Main River (unofficial name) valley is the easiest way from Rensselaer Bay to the icecap, except during high water in summer. The supply of fresh water is abundant, its sources being meltwater from the icecap, ground ice, and snow, and rain. Inglefield Land has more possible airfield sites than the region around Thule, the most suitable being the area near the edge of the ice, where surfaces extending from 1-3 mi. are covered by mantle rock deposits and the slopes are gentle. The 2-mi. long and up to 1-mi, wide ice-dammed lake to the northwest of the reentrant in the ice edge could serve as a landing field for small planes during the winter. There are eight sources of aggregate for highway and building construction in Inglefield Land, including terrace deposits, morainal cones and ridges, modern stream deposits and elevated beaches, till, block fields, talus, and bedrock."—SIPRE.

47013. NICHOLS, ROBERT LESLIE, 1904—. Scientific studies on the Ice Cap in Inglefield Land with special reference to military significance. (*In:* U. S. Army. Transportation Corps. Final report, Operation Ice Cap, 1953, *pub.* 1954, p. 141–43.)

The scientific work conducted in the region to determine the physical characteristics of the icecap and ice-free areas as they may affect surface transportation and military requirements are described. Results are summarized of studies in the bedrock geology; glaciology of the icecap between Thule Takeoff and Uncle (including snow density, temperature, hardness, and stratigraphy, the orientation of sastrugi, thrust planes, moraines, icemargin, microtopography, surface phenomena, and melt-water streams and channels); seismic soundings; surficial deposits; and geomorphology. Trafficability conditions, the availability of construction materials, water supply, and landing facilities are outlined. A base camp was established at 78°13'50" N. 69°37′50′′ W. in Inglefield Land after the party traveled a total of 1300 mi. on the icecap.—From SIPRE.

35, map.)

Contains preliminary report of the activities and findings of the Solair Party (originally: Solo) engaged in geologic mapping of the Thule area June 13-Aug. 25, 1953. The area consists of the ice-free land extending south from Wolstenholme Fiord and the Moltke Glacier to Parker Snow Bay, including Wolstenholme and Saunders Islands. Glacial deposits and bedrock are briefly described and recommendations are made.

47015. NIELSEN, E. STEEMANN. Havet og ernaeringen af jordens befolkning. (Naturens verden, København, 1953. årg. 37, hefte 3–4, p. 53–62, 2 illus., 2 text maps.) Text in Danish. *Title tr.:* The sea and nourishment of the world's population.

Sea-water analysis by Carbon-14 method, which is described, shows that there are substantial amounts of nutritional salts in deep-sea water. Where deep water upwells, as over the underwater threshhold between Greenland and Europe, plankton thrives; small sea animals consume the plankton; and large fish, such as cod, are abundant. Quantitative analysis indicates that food production from the sea has a greater economic potential, than is at present realized. If it were fully utilized and the world's population systematically fed, the emphasis on food source would be significantly different. Copy seen: DLC.

47016. NIELSEN, EIGIL, 1910—. Den "firbenede fisk" fra Central-Østgrønland. (Grønland 1953, hefte 6, p. 201–208, illus., table.) Text in Danish. Title tr.: The "four-legged" fish from central East Greenland.

First finds of this fossil fish were made by some members of Lauge Koch's three-year expedition in 1931–34, including the author, who spent three to four weeks in 1931 on Ymer (approx. 73°10′ N. 23°30′ W.). Later finds brought the number to about 200 individuals. The position of the "four-legged" fish, a link between fishes and amphibians in the evolutionary chain, is explained in detail.

47024. NIELSEN, LAWRENCE ERNIE, 1917—, and F. D. STOCKTON. Flow patterns in glacier ice. (Journal of applied physics, May 1956. v. 27, no. 5, p. 448-53, diagrs.) 6 refs.

p. 448-53, diagrs.) 6 refs.
"The mass of ice varies along the length of a glacier because of the accumulation of snow in its upper regions and the ablation of ice in the lower regions. This mass change brings about variable speeds of flow and complex streamlines. General equations are derived, using a type of plug flow for ice for the following: glaciers of constant arbitrarily shaped cross sections, arbitrary rates of ablation and accumulation, and arbitrary variations of the longitudinal velocity across the glacier; and glaciers of rectangular cross section with varying widths and depths, arbitrary velocity profiles, and arbitrary rates of ablation and accumulation. Streamlines are calculated for five typical cases by using these general equations. The calculated flow behavior is in agreement with the known behavior of glaciers."-Author's abstract. Changes in the equations to render them more general are suggested by the author in No. 47025. Copy seen: DLC.

47025. NIELSEN, LAWRENCE ERNIE, 1917-, and F. D. STOCKTON. Flow patterns in glacier ice. (Journal of applied physics, Nov. 1956. v. 27, no. 11, p. 1386.)

A mathematical analysis is made of the state of internal stress that moves a long glacier tongue along the rocky beds of a broad valley, based on a mechanical model of such a glacier (see also No. 47024). It is shown that in the surface of the ice, a system of external forces, namely of normal, partially compression, partially tensile stresses and of sheer stresses must act. Copy seen: DLC.

"Recent classifications of destructive processes associated with the action of air, frost, water, ice, and organic substances are outlined and discussed. The course of the processes from initial weathering to the deposit of detritus is described, and a new genetic classification is presented with diagrammatic arrangement. Emphasis is given to features of frost weathering and thermal denudation in permafrost, where processes differ greatly from those occurring in zones of seasonal ground freezing. Permafrost degradation and the melting of fossil ice resulting in denudation cause serious displacement of ground strata and the formation of thermokarst."-SIPRE.

47047. NIKONOV, MIKHAIL NIKO-LAEVICH. O zakonomernostíakh razmeshcheniá torfíanykh zalezheľ i osobennostíakh sovremennogo torfonakopleniía. (Akademiía navuk BSSR, Minsk. Instytut torfa. Trudy, 1954. t. 3, p. 40–50, map.) 9 refs. Text in Russian. Title tr.: Regularities in the distribution of peat deposits and characteristics of the present peat formations.

The distribution of peat deposits is considered from the viewpoint of their regional intensity, and of the geological, climatic and other factors involved. Areas of very low, low (from a fraction to a few tons per hectare), and high production (10-a few 100 t./h.) are analyzed, mainly the last, which is identified largely with northern parts of European and Siberian U. S. S. R. and Canada (map, p. 41). This high production area is estimated at some 9 million sq. km., which is about six percent of the earth's surface, and represents about 90 percent of world peat resources. Analysis of peat distribution also indicates that it forms generally in the zone with moisture coefficient more than 1.0, or within the zone where seasonal precipitation exceeds the The mechanism of peat evaporation. formation is affected by hydrological and hydro-chemical processes. Temperature influence, more complicated, involves direct effect of air temperature, also conditions of permafrost which determine the northern limit of the belt of intensive peat formation. This belt usually lies on the boundary of spreading Quaternary glaciers, with the exception of the West Siberian lowland, which is located south of this boundary. Climatic variations within the zone of intensive peat formation have little effect on the intensity except in far northern regions. European U. S. S. R., the area is divided into three zones: in the southern, peat forms exclusively on lowlands; in the central zone, on lowland and upland; and in the northern zone on high level ground. Volumetric distribution of peat is not uniformly affected by geomorphic and geological factors. Topography and erosion factors distort the regularity in formation and distribution of peat deposits. Lfg. 1, p. 1–70, tables, 9 plates.) Text in German. Title tr: The lichen vegetation of the Sarek Mountains.

A study based on author's collections during midsummer 1903, with the Hamberg Expedition. A general part (p. 3-22) deals with the distribution of lichens in this area (approx. 67°27' N. 17°40' E.); the substrate, formation of soredia, the effect of prolonged snow cover upon the lichens, their development at the edge of glaciers, the occurrence of color and of "rusty" forms. The general part is followed by description of 288 species (five probably new) in a taxonomic order, with notes on location of find, substrate, etc. The recorded species are listed on tables, with descriptions of their substrate.

NILSSON, BERTIL, see Beskow, H., and others. Norrbottens bygd . . . 1953. No. 44014.

47050. NILSSON, ERIC. Hypotermi, ett nytt medel inom läkekonsten, 3; anestesiologiska synpunkter. (Nordisk medicin, 1956. bd. 56, no. 44, p. 1585–87, illus.) 14 refs. Text in Swedish. Summary in English. *Title tr:* Hypothermia, a new means in medicine, 3; anesthesiologic considerations.

Contains a discussion of the uptake, detoxication and elimination of various anesthetics during hypothermia, respiratory physiology, and the role of lowered metabolism on the course of general anesthetics; depression and suppression of central thermoregulation and their significance in anesthesiology; control of shivering, etc. Other papers in this series are by J. Adams-Ray and P. Lindgren, q. q. v. Copy seen: DNLM.

47051. NISHIMOTO, SETSUO. Report on whale marking in the North Pacific, 1950. Tokyo, 1951. 25 p. illus., tables, maps. (Japan. Fisheries Agency. Report on whale marking in Japan, no. 2.)

Account of 18 months' marking operations in a belt of some 700 miles east of Hokkaido, between latitudes 39° and 43° (approx.). Information is presented on the plan, the survey boat, its crew, the investigators and methods, with a summary of whales observed. Marking results and chances are given. Whales discovered are described, their species, size and location. Weather conditions are noted. Data are included on distribution of the whales in the area and on capture of marked whales.

47053. NIVEN, CHARLES DAVID. The friction of ice and its economic significance. (Engineering journal, Mar. 1956, v. 39, no. 3, p. 226–27, 230, diagrs.) 5 refs.

"Various theories advanced to explain friction of ice and other materials are reviewed. With normal substances in sliding contact, increase of pressure (loading) tends to facilitate solidification, but in the case of ice it tends to retard solidification and thus decrease friction. The reduction of friction of ice with increase of load (verified in laboratory tests) implies a violation of Amontons' law in addition to raising a significant economic implication. Great commercial possibilities from cheap transportation appear to be provided by the immense icecovered areas of much of the Arctic."-SIPRE. Copy seen: DLC.

47054. NIVEN, CHARLES DAVID. On the effect of speed on the kinetic friction of some plastic materials on ice. (Canadian journal of physics, Apr. 1956. v. 34, no. 4, p. 362–69, diagrs., table.) 3 refs.

Contains a laboratory study on friction values for samples measuring 2.5 x 4.5 cm. of various plastic materials. Drag vs. load curves at -5° and -15° C. are presented. Bakelite and teflon have the lowest values, polyethylene a comparatively high one. Departure from Amontons' law was particularly pronounced at high speeds. High speed reduced friction more markedly at -15° C. than at -5° C. Copy seen: DLC.

**47055. NIVEN, CHARLES DAVID.** On the friction of heated sleigh runners on ice under high loading. (Canadian jour-

nal of technology. July 1956. v. 34, no. 4, p. 227-31, diagrs.) 5 refs.

Contains description of experiments made at speeds of approx. 2 and 6 m. p. h. on a model sled with stainless steel runners heated electrically to 0° C. and unheated, and loaded up to 54 kg./sq. The results indicate that artificially supplied heat cannot act on the asperities of the ice rapidly enough to have much effect on drag. It is inferred that heated runners would not be of economic importance for mechanical transportation at 20 or more m. p. h. Copy seen: DLC.

47056. NOBLES, LAURENCE HEWIT, 1927- . Foliated structures in glacier ice, (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2.

p. 1723-24.)

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31-Nov. 2, 1956. Studies in "cold" glacier ice in northern Greenland have revealed a wide range of tension and shear structures in areas of high and of low flow rates. Normal foliation, abnormally thick blue "yellow" foliation (unequally distributed, finely divided debris), debris bands, and "relict" banding are noted. Tension cracks, crevasses, and ice dikes crosscut the foliation at high angles. Copy seen: DGS.

47057. NOBLES, LAURENCE HEWIT, 1927- Glaciology of the Nuna Ice Ramp. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 53-72,

map, diagrs.) 3 refs.

Observations of a marginal area of the Greenland icecap, consisting of a highland icecap composed of a relatively thin ice carapace resting on a very rugged sub-ice topography, are presented. Negative temperatures prevail in all but the upper few feet of the icecap throughout most of the year. Melting is intense in marginal regions during July and Aug. The firn line in the Nunatarssuak region was at an elevation of about 3100 ft. in late Aug. The daily rate of ablation correlates very closely with the average air temperature recorded at stations on the ice, but correlations with wind velocity, sky cover, and radiation could not be established with certainty. Meltseason trafficability of the ramp is discussed as an indicator of general. conditions in marginal ice areas in the wet-snow zone of North Greenland. In the vicinity of Nuna Knob the ramp

ice is moving at a maximum rate of about 2 in./day. The ice of Moltke Glacier is moving at a maximum rate of more than 3 ft./day. Numerous pits dug in firn provided information on the composition, structure, density, and thermal regime of the snow. Surface features below the firn line such as slush, hummocks, pits coated with brown algae, and streams are described. Slush and streams were the most serious hazards in the area. Copy seen: CaMAI.

47058. NOCKHER, LUDWIG. Fridtjof Nansen, Polarforscher und Helfer der Menschheit. Stuttgart, Wissenschaftliche Verlagsgesellschaft, 1955. 236 p. illus., ports., maps incl. 1 fold. Over 150 refs. (Grosse Naturforscher, Bd. 19.) Text in German. Title tr.: Fridtjof Nansen; polar explorer and humanist.

Biography of Nansen, 1861-1930; includes account of his traverse of the Greenland icecap, 1888-89, studies of Eskimos, the Fram expedition 1893–1896 (p. 29-129); his trip to Spitsbergen in 1912 and voyage to Siberia on the Korrekt in 1913 (p. 146-56). Nansen's activities in helping refugees after World War I is stressed. References include list of Nansen's (110) publications.

Copy seen: DLC.

47059. NOE-NYGAARD, ARNE, 1908- . Comparaison entre les roches grenues appartenant à deux orogénies precambriennes voisines au Groënland. (Sciences de la terre, 1955. Numero hors série, p. 61-75, 2 text maps, diagr., table.) 11 refs. Text in French. Title tr.: Comparison between the equi-granular rocks belonging to two neighboring Precambrian orogenies in Greenland.

Contains results of investigations of the "Nagssugtoquidian" mountain chain in the Nordre Strømfjord region (67°30' N. 53°30' W.) and the "Godthaabidian" chain on Tovqussaq Peninsula (64°51′ N. 52°05′ W.), both part of the Precambrian basement complex of West Greenland. A structural and petrologic analysis was made of the central zone (one of three, cf. No. 24683, 30999) of the "Nagssugtoquidian chain which has undergone recrystallization under granulite facies conditions. Comparisons are made with rocks of the Toyqussaq region, and some conclusions are drawn as to the granitization process in both areas. Discussion follows the text (p. 73-75).

Copy seen: DGS.

47060. NOE-NYGAARD, ARNE, 1908— . Granit og gnejs. (Naturens verden, København, 1953. årg. 37, hefte 9–10, p. 266–76, 3 diagrs.) Text in Danish. *Title tr.:* Granite and gneiss.

Regional metamorphism, mineral facies, and granitization are discussed in a comparison between the classic interpretation of granite developing from a deepseated magma and the more recent transformation theory. By the latter, granite is regarded as made up of sedimentary deposits invested by migma from below but subjected to comparatively low pressure. Granite is viewed as a result, rather than the cause, of regional metamorphism. Wet and dry developments of granite by transformation are described. Primary gneisses and striped granites are believed to be remnants that have escaped later pressures sufficient to produce higher grades of metamorphism.

Copy seen: DLC.

**47061.** NØIS, DANIEL. Utenfor lov og rett. (Polarboken, 1956, p. 24–30, illus.) Text in Norwegian. *Title tr.:* Outside of law and justice.

A Svalbard hunter relates an incident (1905) in which law and justice were bypassed when the chief of the Spitsbergen Coal and Trading Company assumed charge of nearby property and treated hunters unfairly.

Copy seen: DLC.

47062. NOGID, L. M. O derevíannykh sudakh políarnogo plavanifa. (Sudostroenie, Feb. 1938. god 8, no. 2 (74), p. 135–40, illus.) Text in Russian. Title tr.: Wooden ships for arctic navigation.

Reviews the use of wooden vessels of special design with attention to older expeditionary vessels, the Fram, Maud, Perset, Eklips, the Nerpa and other whalers and hunting vessels. The shape and construction of the hulls, highly resistant to ice pressure, are discussed, with reference to the detailed drawings and tabulation of main dimensions which are supplied. Experience of Nansen, Amundsen and Sverdrup (cited) indicate that ships of this form demonstrated poor sailing characteristics in open rough sea, but in ice of high pressure, they were lifted from the water.

47065. NORDENSKIÖLD-SAMFUN-DET I FINLAND. Skärgårdsboken; författad av finlandssvenska forskare. Redaktör: Håkan Lindberg. Helsingfors, 1948. 699 p., illus., ports., maps incl. fold. col., in pocket. Text in Swedish. Title tr.: The Skerries book; written by Finland's Swedish scientists.

Contains 30 papers, two of them of particular interest in relation to the North, abstracted in this bibliography under their authors' names, viz. (titles translated):

LUNELAND, H. Solar radiation and solar climate.

LINDBERG, H. Northern and southern elements in the insect fauna of coastal waters. Copy seen: DLC.

47066. NORDENSKJÖLD, NILS OTTO GUSTAF, 1869–1928. Ueber postarchaeischen Granit von Sulitelma in Norwegen und über das Vorkommen von s. g. Corrosionsquarz in Gneisen und Graniten. (Upsala. Universitet. Mineralogisk-geologiska institut. Bulletin, 1894–95. v. 2, p. 118–28, diagr.) Refs. in text. Text in German. Title tr.: On the post-archean granite about Sulitielma in Norway and the occurrence of the so-called corrosion quartz in gneiss and granite.

The granite near Sulitjelma, which appears as lenses, layers, or dikes, is believed to be a postarchean eruptive, injected into the surrounding rock under high pressure during the building of the Scandinavian mountain chain. In age it approaches the Baltic rapikivi granite but its structure resembles that of the gneiss and basement complex. Macroand microscopic descriptions of the granite and corrosion quartz are presented.

47067. NORDHAGEN, ROLF, 1894—. Bidrag til Norges flora, II; om nyere funn av Euphrasia lapponica Th. Fr. fil. i Norge. (Blyttia, 1952. bd. 10, hefte 2, p. 29–50, 2 illus., text map.) 22 refs. Text in Norwegian. Summary in Eng-

Text in Norwegian. Summary in English. *Title tr.:* Contributions to the flora of Norway, II; new records of *Euphrasia lapponica* Th. Fr. fil. from Norway.

Contains a review of literature (p. 29–32) on Euphrasia salisburgensis and E. lapponica Th. Fr. fil. The latter, an herb endemic to Scandinavia, is found widely over northern Norway and Sweden and in the Enontekis district of Finland, nearly always in company with Dryas octopetala, Carex rupestris and other species inhabiting basic or neutral rocks and soils in dry locations.

Compiled from "Bidrag till Sveriges officiela statistik, C. Bergshand-

teringen. Com. Coll: ii underdåniga berättelse för år 1885."

Of Sweden's 753 iron mines operating in 1885, 381 are noted to be in the Luossajarvi-Gällivare district in the far North. Copy seen: DGS.

47075. NORGES GUIDEN. The Norwegian guide. Oslo, Evident reklame, 1950? 82 p. maps. Text in Norwegian and English.

Brief selective descriptions for tourists, of 54 populated places and well known localities. **Copy seen:** DLC.

47076. NORIN, B. N. Osobennosti semennogo vozobnovlenia drevesnykh porod na p-ve Malyi Amal. (Rastitel'nost' Krainego Severa SSSR i ee osvoenie, 1956. vyp. 1, p. 46–60, illus., diagrs., tables.) 55 refs. Text in Russian. Title tr: Features of seed reforestation of some species of trees on the Malyy Yamal Peninsula.

Results of the author's observations in 1953–54, of the natural reproduction of Siberian larch (*Larix sibirica*), birch (*Betula nana*) and spruce in various types of plant association in the Nyda basin (66°05' N. 74°52' E.) on Malyy Yamal, i. e. the Taz Peninsula. This process in the thin forests of the area is reduced by poor seed, lack of moisture, especially on the watersheds, and by the root system of mature trees spreading wide in the thin soil layer. *Copy seen:* DLC.

47077. NORLINDH, SVEN. Översikt över Sveriges vattenkraft. Stockholm, 1924. viii, 40 p. 4 fold. maps, tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 1, no. 5.) Text in Swedish. *Title tr.:* Summary of Sweden's water power.

Power development of the Swedish river systems is briefly reviewed and industrial consumption noted. Most of the power is concentrated in the larger falls and in rivers from the uplands, the Lule River in Norrland having both the greatest potential and the highest falls. For all the river systems (listed north to south), tabulated data are presented on the drainage area, height of individual falls, and the potential and developed power of each. On three sectional maps, all falls are indicated by proportional circles accompanied by numerals indicating power figured on average flow. Sweden's potential power is compared with that of other parts of the world.

47078. NORLING, GUNNAR. Glaciärsommar i Sarek. (Svenska turistföreningens årsskrift 1956. p. 289–308, 13 illus., 2 text maps.) Text in Swedish. Title tr.: Glacier summer in Sarek.

Living for three weeks in 1954 on the upland of the Sarek mountain group of northern Sweden, and supplied by airdrop, the author and two companions studied the glaciers of the region. Since 1897, Mikkaglaciär (67°25' N. 17°42' E.) had diminished considerably, owing to the recent warmer climate. Relationships of crack systems to glacial condition is discussed. The front of Mikka had retreated 105 m. in six years and 457 m. in 41 years, with a volume loss of 416 million cu. m. of water per year. Other nearby glaciers have been similarly affected. Copy seen: DGS.

47079. NOROIS. Existence d'un circuit autonome en mer de Beaufort. (Norois, Jan.-Mar. 1955. année 2, no. 5, p. 120-22, text chart.) 3 refs. Text in French. Title tr.: Existence of an independent

eddy in the Beaufort Sea.

Based on No. 32994. During Project Skijump I and II in 1951 and 1952, an anticyclonic eddy of Atlantic water was discovered in the Beaufort Sea, entirely distinct from the cyclonic eddy long known in the central and eastern Arctic Basin. The freshness of surface water in the Arctic Basin depends more on distance from the source of salty Atlantic water than on proximity to coastal rivers. Observations on water temperature are given. Activities of U. S. and Canadian ice-breakers in the Northwest Passage, summer 1954 are also noted.

Notes possible use of Finnish fir in proposed factory; also Finland's export of forest products by way of Kirkenes, economic cooperation between north Finland and eastern Finmark in Norway, water power for factory use, road building, etc.

Copy seen: DA.

47084. NORSK SKOGBRUK. Gode muligheter for granproduksjon i Troms; fra en utferd i Harstad distriktet. (Norsk skogbruk, Sept. 1956. årg. 2, nr. 17, p. 577–79, 4 illus.) Text in Norwegian. Title tr.: Good possibilities for spruce production in Troms; from an excursion in the Harstad district.

Account of a visit to a forest plantation, largely spruce, in Astafjord at 69° N., with trees up to 35 years old. Summer temperature, precipitation, soil character, and forest management are discussed; comparison with trees farther south is provisional as little is known yet about effects of summer sunlight, forest thinning and such factors in growth at Astafjord. New plantations in Troms, spraying of fir plantings to control birch, and viability of seed from Troms and Finnmark are also reported. The Troms Forestry Association has more than 800 members.

Copy seen: DA.

47085. NORSK SKOGBRUK. Nord for polarsirkelen, litt prat om skog og natur. (Norsk skogbruk Dec. 1956. årg. 2, nr. 23/24, p. 759-61, 7 illus.) Text in Norwegian. Title tr.: North of the polar circle, a little chat about forest and nature.

Regeneration of birch in upland locations is affected by reindeer; both birch and fir are affected by location and depth to ground water. Destruction of forests in Troms and Finmark by German occupation troops is discussed. Forest conditions in several localities are reviewed. The slow development of scientific forestry in northern Norway is noted.

Copy seen: DA.

47086. NORSK SKOGBRUK. Øket tempo i skogreisingen i Nordland. (Norsk skogbruk, Oct. 1956. årg. 2, nr. 20, p. 674.) Text in Norwegian. Title tr.: Increased tempo in forest growing in Nordland.

Notes four communities in which forest plantings were begun in 1956, making approx. 160,000 acres good forest land now planted. Full forestation of the area will require some 160 million trees at a cost of over seven million dollars, and thirty years' work. **Copy seen:** DA.

47087. NORSKE INSTITUTT FOR KOSMISK FYSIKK. The auroral observatory at Tromsø ( $\varphi=69^{\circ}39'.8N, \lambda=18^{\circ}56'$ . 9 E. Gr.), observations 1954. Bergen, A. S. John Grieg, 1956. 31 p. diagrs., tables (Its: Publikasjoner nr. 38.)

Hourly mean values are tabulated for each month for the magnetic elements of declination, horizontal intensity, and vertical intensity. Comparable data obtained over a brief period during the summer are given also for Bjørnøya (74.5° N. 19.2° E.). Results of the magnetic observations are summarized. Tables of ozone values are included covering nine months at Tromsø and seven months at Longyear, Vestspitsbergen (78.2° N.). Copy seen: DLC.

47088. NORSKE SKOGPLANTE-SKOLER. Planteforsyningen de naermeste år. (Norske skogplanteskoler. Årsskrift, 1952. p. 12–14, 3 tables.) Text in Norwegian. Title tr: Current plant supply.

Tree delivery 1948, 1951, 1952, and needs for 1953–57 are tabulated for each Norwegian province. Nursery production per unit area in northern Norway is slightly less than in the south. Ways to supply the needs are discussed.

\*\*Copy seen: DA.\*\*

47089. NORSKE SKOGPLANTESKO-LER. Skader i skogplanteskolene i 1955. (Norske skogplanteskoler. Årsskrift, 1955, p. 13–16.) Text in Norwegian. Title tr: Damage in the forest nurseries in 1955.

Includes mention of damage from ice in Salten, and from fungus in some of the northern nurseries. Copy seen: DA.

47090. NORSKE SKOGPLANTESKO-LER. Skogplanteskoler i 1951. (Norske skogplanteskoler. Årsskrift, 1951. p. 5–9.) Text in Norwegian. Title tr: Forest nurseries in 1951.

Includes data for northern provinces of Norway in yearly report on amounts of plants and seed involved in operations of provincial forest nurseries. This account appears in each yearly report from 1951 to 1955. Copy seen: DA.

NORTH ATLANTIC REGIONAL AIR NAVIGATION MEETING, see ICAO. Ice . . . runways. 1955. No. 45701. 47091. NORTHERN AFFAIRS BUL-LETIN, v. 3, no. 1-8, Jan.-Dec., 1956. Ottawa, Dept. of Northern Affairs and National Resources, 1956- in progress.

News notes similar in range to previous years (No. 41636) but more informative.

Topics treated include:

Construction work at East Three, new site of Aklavik, Mackenzie District, during 1955-1956, with ten photographs of buildings and roads in Sept. 1956 (no. 1, p. 3-4; no. 5, p. 13; no. 8, p. 9-13);

History of Old Crow, northernmost settlement in the Yukon (no. 1, p. 809);

Housing project at Fort Franklin, a Dene (Athapaskan) Indian settlement at the western end of Great Bear Lake

(no. 2, p. 7-8);

Timber-cutting operations in Wood Buffalo Park (Alberta-Mackenzie District) supervised by Superintendent of Forestry at Fort Smith; construction of plywood-manufacturing plant at Fort Smith and expected 150 percent population increase as result (no. 5, p. 6-7);

Reindeer roundup, Dec. 1955, of the five herds in the Aklavik area, Mackenzie District; study of bone weakness in the animals is being made, forage and grazing conditions investigated (no. 1,

p. 10);

Reindeer herding in Norway, Sweden, Finland, Iceland, and Greenland, comments by B. G. Sivertz (no. 6, p. 3-4);

Economic problems of the trapping population discussed at the Jan. 1956 session of the Northwest Territories Council (no. 3, p. 5-6);

Arctic char processing at Coppermine, by D. S. Wilson, q. v. (no. 3, p. 7-9);

Fish resources and fisheries of Great Slave Lake; summer and winter fishing methods (no. 8, p. 3-5); the common or lake whitefish (no. 7, p. 19-20); the "inconnu" (Stenodus leucichthys mackenzii), fish found in Mackenzie Basin, Yukon, and Alaska (no. 5, p. 11);

Whooping cranes nest in Wood Buffalo Park: causes of their decline, conservation plans, based on talk by J. Lynch of U. S. Fish and Wildlife Service; 28 were counted in 1955-1956 (no. 6, p. 9-10);

Wood bison, its discovery, conservation in Wood Buffalo Park, the present hybrid stock resulting from interbreeding of wood and plains bison (no. 6, p. 15-16);

Caribou population decline: 60 percent in 1948-1955, attributed to wolves and unnecessary slaughter by Eskimos, is discussed by J. P. Gillese (no. 7, p. 4-6);

Wolf control program in Northwest

Territories, 1955-1956, with statistics by district (no. 6, p. 7);

Yukon Forestry Division was formed in 1943, its work covers area of 207,076 sq. mi. (no. 4, p. 10-11); forest fire statistics for Yukon, 1956 (no. 7, p. 10);

New educational program for the Northwest Territories, by J. V. Jacobson,

q. v. (no. 2, p. 11-14);

Educational facilities in Mackenzie District, 1956-1957, school construction, teachers' duties, etc. (no. 4, p. 16-18); school programs broadcast in Eskimo by Rev. F. W. Peacock, Moravian missionary (no. 4, p. 18); summer and other courses for teachers (no. 5, p. 13-14); teaching of English to Eskimos, suggestions by J. J. Bond, Northern Service Officer, Cambridge Bay (no. 7, p. 16-19);

Eskimo carvings on sale in Montreal, etc. (no. 1, p. 6); Christmas party at Frobisher Bay, 1955, account by Irene Baird (no. 1, p. 11-12); new high-vitamin biscuit prepared as dietary supplement for Eskimos (no. 4, p. 13); life of Eskimo women in Greenland, house interiors, crafts, housework, occupations open to women, by Mrs. B. G. Sivertz (no. 6,

p. 4-5);

Greenlanders' visit to Baffin Island, Aug. 1956 in the H. J. Rink and Skarven

(no. 7, p. 11-12);

Eiderdown industry for Cape Dorset (Baffin) and at Payne Bay (N. Quebec): Icelanders' down-cleaning machine demonstrated to the Eskimos (no. 8, p. 5);

1956 Eastern Arctic Patrol carried out by Canadian Government officials on the C. D. Howe, June-Sept. (no. 4, p. 6-7); Northwest Territories Council (11th)

at East Three, new site of Aklavik, Aug. 23-31, 1956 (no. 6, p. 6);

Coat of arms for the Northwest Territories and Yukon described and depicted (no. 3, p. 3-4);

Philip H. Godsell describing York Factory in 1906 (no. 8, p. 6-7);

Mining activities and prospecting in the Northwest Territories; effects on the Eskimo described by K. J. Christie, q. v. (no. 2, p. 9-10; no. 8, p. 14-17).

Biographical sketches of Dept. of Northern Affairs personnel are included in each issue of the Bulletin.

47093. NORTHWEST TERRITORIES. LAWS, REGULATIONS, etc. Ordinances of the Northwest Territories, Canada, 1956. Ottawa, 1956. Mimeographed. Each chapter separately paged in sess. 1; sess. 2, 34 p.

Contains text of 17 ordinances passed by the Northwest Territories Council: sess. 1, chap. 1–5, assented to Jan. 23, 1956; sess. 2, chap. 1–12, assented to Aug. 31, 1956. They deal with fire prevention, insurance sales, revised ordinances, public service expenditures, game, contracts, liquor, motor vehicles, municipal districts, area development, wages, workmen's compensation, taxes, appropriations.

Copy seen: CaMAI.

47094. NORTHWEST TERRITORIES. LAWS, REGULATIONS. etc. Revised ordinances of the Northwest Territories, 1956, being a revision of the Consolidated ordinances of the Northwest Territories, 1898, with the subsequent public general ordinances consolidated to the 1st day of August 1956. Published and proclaimed to come into operation on the 1st day of August 1956. . . . Ottawa, Queen's Printer, 1956. xi, 1018 p.

texts of 103 ordinances Contains(p. 1-892) in force. They deal with such matters as adoption, archeological sites, bills of sale, changes of name, citizenship, creditors, dental profession, elections, employment, financial agreements, fire, game, hospitals, Indians, insurance, jury, liquor, marriage, medicine, mining, police, public health, schools, scientists and explorers, tenants, vital statistics, wills, Yellowknife municipal district, property and water supply, etc. Repealed ordinances are also listed (p. 893-903) with note of chapters and whether all or part was repealed. Appended (p. 905-939) is the basic Northwest Territories Act as amended to 1955 (government, administration of justice, etc.), also the orders in council issued under it. Comprehensive index is appended (p. 940–1018).

Copy seen: DLC.

47095. NORTHWEST TERRITORIES. POWER COMMISSION. Annual report . . . for the fiscal year ended March 31, 1956. Ottawa, 1956. 20 p. fold. map.

Contains summary of operations 1948–1956; reports on power produced at the Snare River, Fort Smith, and Mayo River power plants; plans for new power plants at Fort Simpson, new townsite of Aklavik, and Whitehorse; legislation with regard to Aklavik project; financial conditions of existing plants with itemized statements. Previous reports were listed as No. 36498, 41638. Copy seen: DLC.

47096. NORWAY. GEOFYSISKE KOMMISJON. Geophysical research in Norway 1954–55. Bergen, John Grieg, 1956. 21 p. (*Its*: Annual report, no. 5.)

Reports on work of 15 Norwegian organizations and institutions for the period July 1, 1954 to June 30, 1955. Contents are similar to those of previous four reports (cf. No. 36500). Work in northern Norway, Svalbard, Greenland and Barents Seas was continued. Regular publications of the organizations, and individual papers (40) published during the 1954–1955 period are listed.

Copy seen: DGS.

47097. NORWAY. METEOROLOGISKE INSTITUTT. Årsberetning for de meteorologiske institusjoner i Norge. Oslo, 1906- in progress. Text in Norwegian. Title tr: Annual report for the meteorological institutions in Norway.

Administrative report on finances, publications, personnel, services, and work at stations, including those at Tromsø, Bjørnøya, Jan Mayen, Hopen and Vestspitsbergen, also North Atlantic weather ships. In progress since the latter 19th or early 20th century (file from 1905/06 to date at DWB), these reports indicate special activities as well as scope of meteorological and some geophysical work. Recent issues, e. g. 1954/55, pub. 1956 (71 p.), summarize the weather forecasting service, that of North Norway included, also the hunting regions of Vestisen and Østisen (west and east icepacks). File seen: DWB.

47098. NORWAY. METEOROLOGISKE INSTITUTT. Bernt Johannes Birkeland,

1879–1955. (*Its*: Årsberetning, 1954–55, *pub*. 1956, p. 1–5, port.) 31 refs. Text in

Norwegian.

Obituary of this outstanding Norwegian meteorologist. His scientific activities are reviewed, and 31 of the more important of his numerous publications are listed, including some on Svalbard, northern Norway, etc.

Copy seen: DWB.

47099. NORWAY. METEOROLOGISKE INSTITUTT. Karter over snøakkumulering. (Naturen, Mar. 1950. årg. 74, nr. 3, p. 76–83, text map.) Text in Norwegian. Title tr.: Maps of snow accumulation.

In cooperation with the Norwegian hydrologic survey on stream systems and electricity, the meteorological institute began to publish maps of the amount of snow as a percentage of normal accumulation at stations on the last day of each of the first four months of 1950. The maps were not to include north Norway, because of insufficient data and/or delay in their transmittal from the interior of Nordland, Troms and Finnmark.

NORWAY. NORSK POLARINSTITUTT, see Norway. Sjøkartverket. Katalog over sjøkarter . . . 1952. No. 47100.

47100. NORWAY. SJØKARTVERKET. Katalog over sjøkarter (Chart catalogue) og farvannsbeskrivelser vedkommende den norske kyst m. v. samt arktiske sjøkarter og farvannsbeskrivelser utg. av Norsk polarinstitutt. Oslo, 1952. 14 p., maps (part fold.) Text in Norwegian and English, map titles in Norwegian. Eng. title: Chart catalog and descriptions of the Norwegian coast, published by Norway's chart service, with aretic charts and descriptions published by the Norsk Polarinstitutt.

Contains index maps and lists of maps on various seales available for individual sections of the Norwegian coast from the southwestern border of Sweden to the northwestern border of the Soviet Union; also charts from northern Norway to, and including all of Svalbard. General information: index numbers, scales, projections, timeliness and corrections, and purchase instructions introduce this catalog.

Copy seen: DLC.

47101. NORWAY. STATISTISK SENTRALBYRÅ. Norges bergverksdrift, 1866–1954. Oslo, 1874–1956 in progress. 62 nos. tables (Norges offisielle statistikk, C. nr. 12 (1866-1882); rekke 3. nr. 40, 128, 165, 231, 285, 340 (1883-1898); rekke 4, nr. 59, 113 (1899-1903); rekke 5, nr. 33, 54, 76, 111, 135, 159, 197 (1904-1911); rekke 6, nr. 2, 29, 60, 95, 138, 155 (1912-1917); rekke 7, nr. 14, 48, 70, 95, 146, 178 (1918-1924); rekke 8, nr. 3, 35, 78, 105, 137, 155, 193 (1925-1931); rekke 9, nr. 15, 42, 69, 95, 121, 147, 176 (1932-1939); rekke 10, nr. 4, 26, 49, 68, 87, 105, 130, 147, 176 (1940-1947); rekke 11, nr. 8, 55, 105, 124, 162, 197, 232 (1948– 1954)). Text in Norwegian. Summary, table of contents, text column & table headings in English. Title tr.: Norway's mining industry, 1866 -1954.

Annual publication since 1906 (except 1919-1920); prior to 1906, two-three years to an issue. Contains detailed annual statistics, until 1916 compiled from reports by government-appointed mine controllers; since 1916, based on reports from each establishment. Ore mines, pyrite mines, coal mines, and establishments engaged in metal production are covered. Also included are the annual reports prepared by the mine controllers. These deal with companies engaged in stone quarrying and nonmetallic mining as well as with the above mine categories. Mines and mining companies in North Norway are includep; also, since 1926, separate statistics on coal production in Svaibard.

47102. NORWAY. VASSDRAGS- OG ELEKTRISITETSVESENET. Hydrografiske avdelingen. Vannstandsobservasjoner i Norge, 1912–1939, 1946–1953. Oslo, H. Aschehoug, 1913–1940, 1948– 1955. 36 v. fold. graphs, tables. Text in Norwegian. Title tr.: Water-level

observations in Norway, 1912–1939, 1946–1953.

Annual report, comprising tables of daily records for stations; high, mean, low, and average height of water for the year; duration of ice cover; and highest and lowest levels. Yearly conditions, periods of flow and high and low water in various basins are summarized. Drainage basins in northern Norway are included. Prior to 1938, the report was entitled Vandstandiagttagetser i norske vasdrag, and was issued by the Vassdragdirektør. File seen: DGS; DLC.

47103. NOVIKOV, G. A. Khishchnye mlekopitaiushchie fauny SSSR. Moskva-Leningrad, Izd-vo Akad. nauk SSSR, 293 p., 191 illus., front. Akademiía nauk SSSR. Opred. po faune SSSR, no. 62.) 16 refs. Text in Russian. Title tr.: Carnivorous mammals of the U. S. S. R. fauna.

Contains a systematic index to the order Carnivora and in the introductory part (p. 9-34), characteristics of the order, cranial structure and dental system and their age changes; data on geographic distribution, ecology and economic importance are included. Some carnivores, like wolf, are pests; some are useful as source of valuable furs and as destroyers of agricultural and forest pests. In the special part, is a table for determination (by external and cranial characteristics) of six families, 17 genera and 43 species, of which two are introduced. Some economically important species are described in detail, with data on systematics, biology, ecology, synonymy and geographic distribution. Among them are the white bear (Talassarctos maritimus), arctic fox (Alopex lagopus), fox (Vulpes vulpes), brown bear (Ursus arctos), sable (Martes zibellina) and ermine (Mustela erminea), native to tundra or forest-Indices of Russian and tundra zone. Latin names are appended.

47104. NOVIKOV, L. V. O dorozhnosinopticheskoĭ sluzhbe. (Avtomobil'nye dorogi, Jan. 1956. god 19, no. 1 (159), 22 - 23)Refs. Text in Russian. Title tr.: Synoptic service for roads.

Describes weather stations along roads to study and control transportation. Synoptic data from these observation posts are used in warning of change in weather and road conditions: temperature changes, deformation of the road surface (cracks, heavings, washout, etc.), snow and ice cover, drifts, protection, variation in coefficient of cohesion, ground moisture, depth of freezing, deformation in mountain road, etc. Copy seen: DLC.

47105. NOVIKOV, VALER'IAN DMI-TRIEVICH. Iz istorii osvoenifa Sovetskol Moskva, Gospolitizdat, 1956. 214 p. 22 illus., 7 maps incl. 2 fold. Text in Russian. Title tr.: From the history of the conquest of the Soviet Arctic.

Contains chiefly historical data exploration of the region with rather general notes on the industrialization of the area, and improvement of the life of the native population under the Soviet regime. Introduction outlining major expeditions and studies of pre-revolutionary times, is followed by account of early Soviet activities (1918 to 1928): the organization of so-called "Kara operations" (1920–28) to establish a sea route via the Yenisey to central Siberia; the establishment of the Floating Marine Institute in 1921, training of scientific personnel, and its expeditions, at first on the Malygin and later on the Perset (1921–27); establishment of Northern Scientific-Industrial Expedition in 1920 and the study and development of natural resources of the Kola Peninsula, Novaya Zemlya, White and Barents Seas; educational and cultural activities among native tribes. The second period, from the beginning of the first five-year plan in 1928 until 1937, was devoted to exploration and development of the Northern Sea Route by the expeditions of the Sibiriakov in 1932, the Cheliuskin in 1933 and Litke in 1934; successful navigation in 1935 by the transport vessels Iskra, Vantsetti, Stalingrad, and Anadyr' established the possibility of cargo transportation from Leningrad to Vladivostok via the shorter, northern sea route. Polar stations were set up in Franz Joseph Land, Severnaya Zemlya (expedition of G. A. Ushakov in 1930), Novaya Zemlya, etc.; expeditions sent to the northern Siberian coast and tundras, etc. Introduction of aerial reconnaissance in the Arctic is noted; industrial developments are outlined in Kola Peninsula (apatite, minerals, fisheries), in the Pechora region, Vorkuta, Usa (coal, oil), and at Igarka on the Yenisey River (lumber). The most important feature of the third period, since 1937, has been the exploration and study of the Arctic Basin initiated by the aerial expedition of Otto Shmidt (pilot Vodop'anov) from Rudolph Island to the North Pole in 1937, and establishment of drifting station North Pole-1. Complex study of the central Arctic, interrupted by the world war, was continued by the drifting stations North Pole-2, 3, 4 and 5 during Their scientific achievements 1950-56.are noted. Expeditionary routes throughout are shown on maps. Copy seen: DLC. NOVIKOVA, A. S., see Offman, P. E., and A. S. Novikova. O paleozofskom vulkanizme . . . 1950. No. 47146.

Note on the "cascade" of the hydroelectric plants planned on the Yenisey River, the first at Krasnoyarsk, with its hundred-meter dam. *Copy seen:* DLC.

47107. NOYES, JOHN RUTHERFORD,
d. 1956. The Alaska National Guard.
(Military engineer, Mar.-Apr. 1956. v.

48, no. 322, p. 96-98, illus.)

Discusses the organization and functions of the Alaska National Guard: its two Eskimo Scout Battalions, the 207th and 208th Separate Infantry Battalions and the 144th Fighter-Interceptor Squadron of the Air National Guard. The Eskimo Scouts man the entire northern and western coasts of Alaska. Eskimo village National Guard detachment has a non-commissioned officer in charge, who is a head man in the village. The infantry units which are composed of whites and Indians are located at Juneau, Ketchikan, Sitka, Anchorage, Seward, Fairbanks, Kodiak and others. The Air National Guard is located at Anchorage. Copy seen: DLC.

47109. NUORTEVA, MATTI. Havaintoja eräiden hyönteisten esiintymisestä pakkasessa. (Suomen hyönteistieteellinen aikakauskirja, 1951. v. 17, no. 3, p. 117.) Text in Finnish. Summary in English. *Title tr.:* Observations on some winter insects.

Contains notes on Chionea crassipes and Helomyza nigrinervis, observed moving on snow at Sodankylä in Kemi Lappmark (67°25′ N. 26°35′ E.) during the period Jan. 26-Mar. 8, 1951, when the temperature was sometimes  $-6.8^{\circ}$  C. to  $-12.7^{\circ}$  C. Copy seen: DA.

47110. NUORTEVA, MATTI. Kirjanpainaja (*Ips typographus* L.) kuusirajan pohjoispuolelta. (Suomen hyönteistieteellinen aikakauskirja, 1955. v. 21, no. 4, p. 195-96, text map) 5 refs. Text in Finnish. Summary in German. *Title* tr.: *Ips topographus* L. (Col., Scolytidae) found beyond the northern fir limit in Finland.

Records find of this wood-borer, together with I. acuminata, under the bark of a single fir tree between Kaamanen and Syysjärvi in the Inari region of Finnish Lapland, 60 miles north of the nearest fir forest. Copy seen: DA.

47111. NUORTEVA, MATTI. Über den Fichtenstamm-Bastkäfer, Hylurgops palliatus, Gyll. und seine Insektenfeinde. Helsinki, 1956. 118 p. illus., tables. (Acta entomologica fennica, no. 13) About 170 refs. Text in German. Summary in Finnish. Title tr.: The pine bast-beetle Hylurgops palliatus, Gyll. and its insect enemies.

Results of a study conducted during 1953–55 in southern Finland, and (in 1954) in Lapland. Occurrence and geographic distribution, biology (food, breeding, phenology, etc.) are reported; population movements are discussed. Enemies and parasites of this species were also studied and found to be polyphagus, i. e. preying on other species too.

47112. NURNBERGER, JOHN IGNATIUS, 1916—, and M. W. GORDON. Effects of brief stress on the rhibonucleic acids and the labile nitrogen pool of brain and liver in the rat. (Progress in neurobiology, 1; neurochemistry, 1956. v. 1, p. 122–42, illus. tables.) 35 refs.

Contains a study of the magnitude and significance of the labile nitrogen pool of brain in animals briefly exposed to cold  $(-5^{\circ}\pm 2.5^{\circ}$  C. for 1 hr.). Fed, fasted or bilaterally adrenalectomized animals were used, and simultaneous changes in the liver of the same animals traced, for comparison. It is indicated that adrenocortical mechanisms make the pool easier available as a source of stop-gap energy.

"Sea ice research has reached a critical point in its development. In place of a geographical statistical trend, there is now a geophysical approach. Whereas the main problem has been the explanation of the phenomena of sea ice in space and time, more and more attention is being devoted to the connection between the state of the ice and the changing conditions in the water and the air."—Author's abstract.

Mention is made of German and Soviet ice reconnaissance flights and cruises during World War II; the need for working up of observational material from ice reconnaissance and lack of specialists required; lack of a uniform terminology for sea ice; new ice foreasting methods.

47114. NUTRITION REVIEWS. Adrenal steroid output by hypothermic dogs. (Nutrition reviews, Apr. 1956. v. 14, no. 4, p. 117–19.)

Several recent (1954-55) investigations on the functional responses of the adrenal cortex to stress are reviewed and discussed. Hypothermia, alone or combined with hemorrhagic shock, is dealt with.

\*\*Copy seen: DNLM.\*\*

47115. NUTT, DAVID C. Blue Dolphin Labrador Expeditions, oceanographic station data report, part 1. [Hanover, N. H., Dartmouth College], Feb. 1956: 61 p. text maps, tables. Typescript. 7 refs.

Contains data obtained from stations in the Strait of Belle Isle, St. Lewis Inlet, Kaipokok Inlet, the Nain, Hebron, and Seven Islands Bay areas during 1949-1954. Results from the Hamilton Inlet-Lake Melville estuary are in preparation as pt. 2. For each station (cf. maps), geographic coordinates, water depth, weather conditions, date and time of observations are noted. Temperature, salinity, density, oxygen and phosphate content are given for depths, between 0-75 and 150 m. Copy seen: CaMAI.

47116. NUTT, DAVID C., and L. K. COACHMAN. The oceanography of Hebron Fjord, Labrador. (Canada. Fisheries Research Board. Journal, 1956. v. 13, no. 5, p. 709–758, illus., tables, map.) 16 refs.

A study of the oceanographic regime

and physical environment of the Fjord (58°10′ N. 63° W.) based on operations during 1949, 1952 and 1954 from the research vessel Blue Dolphin. An introductory part deals with bathymetry, climate, fresh-water contribution and water movements. This is followed by accounts on temperature and salinity; O<sub>2</sub> and phosphate contents; temperaturesalinity relationships and long-term trends; ice conditions; water exchange; vertical mixing of water; general and theoretical aspects. Station data, summarized in tabular form, are appended. Copy seen: DI.

NUTT, DAVID C., see also Scholander, P. F., and others. Gases in icebergs. 1956. No. 47843.

47117. NUTTALL, C. J., Jr., and J. P. FINELLI. Vehicles in snow; a critical review of the state of the art. A Corps of Engineers Research and Development report prepared for Office of the Chief of Engineers and Waterways Experiment Station, Vicksburg, Miss. Aug. 1955. 71 p. tables. (U. S. Army. Corps of Engineers. Trafficability of Snow, Report no. 1. Technical memorandum no. 3–414.) 206 refs.

The design and operation of snow vehicles as well as methods of predicting vehicular performance in snow are critically reviewed. Physical and mechanical properties of a snow cover with reference to trafficability are discussed. The status of vehicle-snow research and existing self-propelled snow vehicles are examined in detail. Characteristics of various snow vehicles successful in themselves and/or representing potentially useful concepts are tabulated. Sleds and unpowered trailers, and mobility testing of vehicles in snow are briefly outlined. Specific recommendations for future research and a selected bibliography are included. Copy seen: AMAU.

47118. NYBERG, ALF. Temperature measurements in an air layer very close to a snow surface. Stockholm, 1939. p. 234–75, diagrs., illus., tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden. Serien uppsatser, no. 27.) 27 refs.

Temperatures at intervals up to a height of 25 mm. and at 1400 mm. above the snow were measured with a platinum resistance thermometer. The measurements were made during 1936–1937 at the Meteorological Institute of Upsala

University. The temperature was found to vary exponentially with height under stable conditions. Temperature fluctuations calculated for different heights indicate that turbulence occurs over snow at a height of less than 1 mm. The methods of measurement are discussed, and all data are tabulated. *Copy seen:* DWB.

47122. O'BRIEN, JOHN PATRICK, 1910—, and W. L. GOJMERAC. Radiosensitivity of larval and adult amphibia in relation to temperature during and subsequent to irradiation. (Society for Experimental Biology and Medicine, Proceedings, May 1956. v. 92, no. 1, p. 13–16, illus.) 6 refs.

In larval frogs, lowered body temperature (3° C.) only delayed the lethal effects of radiation and mortality was essentially the same upon return to room tempera-

ture as in control. In salamander larvae under similar conditions, there was less damage to internal organs and less abnormal responses. Adult salamanders showed a significantly lower mortality after irradiation at a low body temperature.

47123. OBRUCHEV, SERGEĬ VLADI-MIROVICH, 1891 – Editor. Spravochnik puteshestvennika i kraeveda; sostavlen gruppoĭ avtorov pod redaktsieĭ S. V. Obrucheva. Moskva, Gos. izd-vo geogr. lit-ry, 1949–1950. 2 v.: 808 p., illus., figs., diagrs., fold. map (in pocket); v. 2: 684 p. illus., figs., diagrs., plates (3 col. in pocket), tables, fold. map (in pocket). Over 1000 refs. Text in Russian. Title tr.: Reference book for travelers and regional explorers; written by a group of authors, edited by S. V. Obruchev.

A collection of 53 papers prepared by 35 authors according to plan, with the Soviet explorer S. V. Obruchev as editor and principal contributor. They are intended to furnish members of scientific (land) expeditions, and others with essential information and guidance in travel and investigation. The first volume deals with the organization and techniques of travel, the second with principles of field work in the various Most of the papers listed sciences. below, with title translated, are relevant for expeditions into any parts of the U. S. S. R., a few (\*) which refer specifically to arctic and subarctic areas are described in this Bibliography under their authors' names.

Vol. 1: Preparation of the expedition, by S. V. Obruchev (p. 3-70) deals with general problems of organization; tents, sleeping and other equipment, clothing, footwear.

Camp and travel practice, by S. V. Obruchev (p. 71–111) covers packing, transportation, summer and winter camps, hygiene, insect control, schedule of movements and work.

Food and its preparation, by S. V. Obruchev (p. 112-51): dietary needs, food supplies, their kind, quantity, etc., preservation and transport, vitamin content and caloric value; cooking utensils, fire building, etc.

Hunting and fishing are discussed by Obruchev (p. 152–75) as means of supplementing rations and improving the diet; weapons and implements are indicated, methods of catching game and fish, etc., are explained.

\*Edible plants (p. 176–203) by V. L. NEKRASOVA, q. v.

Summer transportation by S. V. Obruchev (p. 204–263): travel by foot, riding; also draft and pack horses and their use, various other pack animals, including dogs and reindeer; wheeled transport; saddles, harness, wagons; packs, knots, etc. Notes are included on transportation in Yakutia.

\*Winter transportation (p. 264–99) by S. V. OBRUCHEV, q. v.

Water transportation also by Obruchev (p. 300-348): types of boats, including baldarka, their construction, equipment and repair; sails; navigation of sandbars and rapids; coastal and lake boating, etc. Scattered remarks on such transportation in northern Siberia are included.

Mechanical transportation is treated by  $\widehat{\Lambda}$ . I. BronshteIn (p. 349–80), who describes types, selection and use of motor vehicles, including tracked and amphibious vehicles, boats and gliders.

\*First aid in accidents and emergency sickness (p. 381–415) is presented by A. M. ABEZGAUZ, q. v.

\*Care and treatment of expeditionary animals (p. 416-45) are explained by V. F. ADAMANIS, q. v.

Photography and moving pictures by I. I. Gomel'skil (p. 446-524) deals in detail with the apparatus, equipment and field laboratory; offers rules for photographic work generally, and especially for that on various objects under observation.

\*Radio (p. 525–50) is treated by V. N. IVANOV, q. v.

The simplest means of orientation in space and time are explained by Obruchev (p. 551–79); practical advice on making astronomical and geodetic observations and on determination without, or with home-made, instruments; signaling.

Maps and mapping by K. A. Salishchev and IU. A. Meshcherîakov (p. 580–683) presents the main map series of the U. S. S. R.; their scales, mathematical, geodetic and geographic elements, coverage, etc.; map reading and field use, including materials of aerial photography; mapping with simple instruments.

Barometric levelling by IU. A. Meshcherfakov (p. 684–710) outlines principles, instrumentation, methods of work, use of tables, etc.

In a final chapter, "Technical advice and recipes" (p. 711-22), Obruchev gives miscellaneous expeditionary "house-keeping" supplies: putties and seals, writing materials, adhesives, metals, glass, dishes, etc. Appended (p. 723–98) are geodetie, astronomical and mathematical tables.

Vol. 2 comprises papers by specialists on principles and methods of field investigations, viz.:

Complex physiographic exploration by V. P. Lidov and N. A. Solnfsev (p. 9–16): organization, preparation and methods of field work.

\*Study of the weathering process (p. 17-27) by N. I. NIKOLAEV, q. v.

Study of effects of wind and investigation of sands and loess (p. 28–52) by B. A. Fedorovich.

Study of effects of ground water, by N. I. Nikolaev (p. 53-70) deals with springs and their water, karst phenomena, land slides.

Study of effects of running water (p. 71–92) by N. I. Nikolaev covers erosion phenomena, river valleys, terraces and deltas.

Hydrological investigation of rivers, by L. K. Davydov (p. 93–107) outlines instruments, purposes, methods.

Study of mineral springs, by N. I. Tolstikhin (p. 108-114) explains the geomorphic and hydrological investigation of springs and determination of the physical and chemical properties of their waters.

Complex study of lakes, by N. I. Semenovich (p. 115–36) states purposes, instruments, methods.

Complex study of marshes, by I. D. Bogdanovskafa-Gienef (p. 137–49) deals with the problems and methods of the hydrological, geomorphic and botanical investigations of various types of marshes.

Study of sea coasts (p. 150-64) by V. P. Zenkovich, describes instruments, aspects and methods of study, main types of sea coasts, etc.

Study of present-day glaciers, by S. V. Kalesnik (p. 165–70) indicates the main features, origin, changes and types of glaciers in the U. S. S. R.

Study of the remains of ancient glaciation, by S. V. Obruchev (p. 171–92) covers the general features, moraines, fluvio-glacial deposits, valley forms, types of glaciation in mountains and plains, etc.

Study of the snow cover (p. 193-99) is outlined by G. D. Rikhter and L. D. Dolgushin.

\*Study of permafrost as a geographical factor (p. 200–224) is treated by S. P. SUSLOV, q. v.

Geological field studies are outlined by

Obruchev in papers (four) on: relief and deposits of areas adjacent to glaciers (p. 225–37) dealing with solifluction processes, stone rivers, structural soils, frost fissures, etc.; on volcano and earthquake observations (p. 238–50) dealing with exploration of extinct Cenozoic volcanoes in the U. S. S. R. and with non-instrumental observation of earthquakes and tremors; on geologic surveying (p. 251–337): instruments, methods, technique in sediment and rock studies, with tabulation of geological history; and finally on collecting fossil remains of fauna and flora (p. 338–50).

Search for useful minerals is outlined by M. I. Itsikson (p. 351-79): the principal minerals, prospecting methods.

etc.

Complex study of the recent earth crust movements is outlined by N. I.

Nikolaev (p. 380-87).

Geomorphic investigations, by I. S. Shchukin (p. 388-403) deals with instruments and methods of exploration of valleys and mountains.

Practical applications of geomorphology are presented by T. V. Zvonkova (p. 404–413): in prospecting for useful minerals, railroad construction, and in agriculture.

Soil study (p. 414-30) is outlined by

B. F. Petrov.

Field meteorological observations and weather forecasting based on local indicators (p. 431-62) are discussed by L. A. Vitel's.

\*Studies of flora and vegetation (p. 462-96) are treated by V. B. SOCHAVA,

q. v

\*Zoological investigations (p. 497–535) are treated by A. A. NASIMOVICH; animal tracks and methods of tracking terrestrial vertebrates (p. 536–52), by A. N. FORMOZOV; and effects of animals' activity on formation of the earth surface and soils (p. 553–56), by A. N. FORMOZOV; q. q. v.

Phenological observations are dealt with by N. N. Galakhov (p. 557-78): meteorological and hydrological phenomena in relation to flora and fauna.

Archeological investigations (p. 579–92) by L. Â. Krizhevskaîa, deals with methodics of field work in the U. S. S. R., including stone age finds on the Lena River, White Sea coast and Kola Peninsula.

\*Ethnographic observations (p. 593-612) are treated by N. A. SHMIDT; and anthropological observations (p.

613–24) by G. F. DEBETS, q. q. v. Investigations in economic geography (p. 625–35) and human geography (p. 636–47) are outlined by  $\overline{\mathbb{U}}$ . G. Saushkin.

Study of geographic names is reviewed by E. M. Murzaev (p. 648–53); and their\* transcription is treated (p. 654–63) by

S. V. OBRUCHEV, q. v.

Appended are hunting and other regulations of interest to field investigators; also a list of state preserves, including Kandalakshskiy, Kondo-Sosvinskiy, Kronotskiy, Laplandskiy and Sem' Ostrovov, with notes on their administration, etc.

47124. OBRUCHEV, SERGEĬ VLADI-MIROVICH, 1891–. Transkriptsifa geograficheskikh nazvanit. (*In his:* Spravochnik puteshestvennika, t. 2, 1950, p. 654–63, table.) Text in Russian. Title tr.: Transcription of geographic names.

Expounds rules for transcribing Russian and transliterating non-Russian names. Correction of old names of features and introduction of new ones are explained. Several of the names discussed are of arctic areas.

Copy seen: DLC.

47125. OBRUCHEV, SERGEĬ VLADI-MIROVICH, 1891—. Zimnit transport. (In his: Spravochnik puteshestvennika, t. 1, 1949, p. 264–99, illus.) 38 refs. Text in Russian. Title tr.: Winter transportation.

Discusses problems of expeditionary travel in winter: skis and their use, including that with sails, also description of the Chukchi and Indian skis i. e. snowshoes (p. 270–75). Reindeer- and dog driving (p. 283–96) are described, harness, hitches, sleds, etc. The winter condition of such instruments as watches, chronometers, photographic apparatus, odometers, etc., is discussed, and their maintenance at low temperatures.

Copy seen: DLC.

47126. OBRUCHEV, VLADIMIR AF-ANAS'EVICH, 1863–1956. Osnovy geologii; populfarnoe izlozhenie. Moskva. Izd-vo Akademii nauk SSSR, 1956. 360 p. illus., port., map, diagr. 56 refs. Text in Russian. *Title tr.:* Fundamentals of geology; a popular exposition.

Physical, or dynamic, geology is outlined with major references to the U. S. R. and specific examples from other countries. Geological forces creating and transforming the earth crust are discussed. European and Siberian glaciers

are described with illus. and maps of the maximum extent of historic glaciations, including the Taymyr, Verkhoyansk, Chukotski, Kamchatka. Identification of the various glacial ages and hypotheses for the cause of ice ages are discussed. Regions included are Svalbard, Franz Joseph Land, Novaya Zemlya, Severnaya Zemlya, Ostrov Bennet and the Canadian Arctic archipelago (p. 125–60). Volcanic formations and activities in Kamchatka are mentioned with illus.

47129. OBSERVATORY. Glaciology, the flow of glaciers. (Observatory, Apr. 1950. v. 70, no. 855, p. 63-69.) 3 refs.

Reports a discussion by the Royal Astronomical and British Glaciological Societies held on Jan 7, 1950, on old and new theories of glacier motion. The new

theories considered include the rotational slipping hypothesis advanced by W. V. Lewis, and that of E. Orowan and J. F. Nye based on the concept of ice as an ideally plastic substance. The results of observations in various countries relating to glacier flow are summarized. Evidence was found in a natural tunnel on the edge of the Greenland icecap of local extrusion flow of ice under pressure, the crystal size diminishing with distance from the rock wall and showing a clear boundary between extruded ice and normal ice.—

Text in Swedish. Summary in English. *Title tr.:* Precambrian geology of Norrbotten province, in brief summary.

Regional mapping of Sweden's northernmost province begun in 1946, is to be completed about 1956. Principal rocks of the two main Precambrian cycles, Sveco-Fennic and Karelidic, are described. Severe denudation of the older was followed by sedimentation, intense folding, and by migmatization of the older rocks and intrusions of deep-seated rocks which are divided in two series. Local variations are distinguished. Several localities in the arctic section of the province are noted.

To coordinate results of geological investigations along the Finnish-Swedish border, members (six) of the two countries' geological surveys undertook a joint six-day excursion from Haparanda-Torneå northward. In Finland, they traveled the route Tornio-Ylitornio-Rovaniemi-Kemi-Oulu and environs, and in Sweden the Haparanda-Kalix-Karungi route with a side excursion to Balingsberget. Consideration of previous studies and discussions of the geological nature of outcrops at points along the way comprise the body of this report.

47139. OESAU, WANDA. Hamburg unternahm 6,000 Arktisfahrten auf Walfang und Robbenschlag in den Jahren 1643–1861. (Polarforschung, 1954, pub. 1956. Bd. 3, Heft 1–2, Jahrg. 24, p. 298.) Text in German. Title tr: Hamburg undertook 6,000 arctic voyages for whaling and sealing during the years 1643–1861.

Contains a selective review, No. 47140. Copy seen: DLC.

**47140. OESAU, WANDA**. Hamburgs Grönlandfahrt auf Walfischfang und Robbenschlag vom 17.–19. Jahrhundert.

Glückstadt - Hamburg, J. J. Augustin [1955]. 316 p. illus., 71 plates incl. maps, facsims, graph, ports. Text in German. Title tr: Hamburg's Greenland voyages for whaling and sealing, 17-19th century.

A comprehensive monograph on a period of most successful sea voyages of Hamburg, written by a member of an old family of whalers and a lifelong student of German whaling. Successive chapters deal with: the hunting grounds. their description and value: Spitsbergen, Jan Mayen, arctic areas and Davis Strait; and with voyages to these grounds, 1643-1861; ship-owners and their business; ships and their histories, commanders and crews, the lot of the whalers' wives. Relics, equipment and buildings of the period are traced, also exhibits, songs of whalers, etc. Appended are lists of archival and other sources, indexes of geographic names, ship commanders (818) and owners (332), of ships (565), etc., together with chronological analysis of voyages. Contemporary maps, documents, illus. of vessels, etc., are reproduced. This extensive study and presentation of source materials in handsome format is similar to the writer's work on Schleswig-Holstein's voyages (No. 36564). Copy seen: NhDStef.

ØSTBY, H. Småhvalfangsten 47141. (Norsk hvalfangst-tidende, May 1955. Årg. 45, nr. 5, p. 241–49, map, diagr.) Text in Norwegian and 1956. tables, diagr.) English. Title tr: The 1955 smallwhale catch.

Contains data for Norwegian and Spitsbergen waters and the Barents Sea; tables show number of vessels taking part, whales caught (4,491), and geographical distribution of catches; yield of meat, blubber and bone (given) is valued at 9,446,479 Norw. kr.

Meteorologiska och hydrologiska institutet. Meddelanden, bd. 6, no. 6.) 18 refs. Text in Swedish. Title tr.: Ice conditions along the coasts of Sweden, during the winters 1870/71-1934/35.

Data based on 13,000 ice reports from 232 coastal stations are presented. Included are mean values of ice conditions, ice formation and break-up, duration and thickness of the ice covers, fast ice, drift ice. A chronological survey is given of the ice conditions in the major ports and harbors. Copy seen: DWB.

47143. ÖSTMAN, CARL JOHANN. Isvintern 1940-41, en jämförelse med 1939-40. Stockholm, 1941. 10 p. diagrs., maps, tables. (Sweden. Meteorologiska och hydrologiska institutet. Medde-Serien uppsatser, no. 38.) 8 ext in Swedish. Summary in landen. Text in Swedish. refs. English. Title tr.: The ice winter 1940-41, in comparison with 1939-40.

Ice and temperature data for the Swedish coastal and Baltic Sea area are discussed. The 1940-41 winter, although very cold, was not as cold as the previous one. However, the ice period was longer during 1940-41 except for the Skagerak, the Kattegat, and the southern Baltic. All waters were free of ice on June 6. Details on ice conditions at selected

stations are tabulated.

Contains new data on volcanic activities in the central Timan Ridge (64° N. 52° E.) during the middle-upper Devonian. Locational and genetic relations of volcanic rocks in respect to the Timan's ruptures are described. Interrelations between basic rocks (which filled crevices in the Givetian sandstones), the overlying rocks, and rocks forming interlayer deposits are thoroughly discussed. Magmatic activity in the Paleozoic era occurred at the end of Givetian and at beginning of Frasnian stage (lower level of upper Devonian system). The width of volcanic crevices varies (up to 100 m.) and the length to many kilometers. penetration of diabase into deep ruptures is connected with non-uniform lowering of the Pechora syncline, resulting in displacement of the horizontal Paleozoic layers of the Timan structure.

47147. OFFMAN, P. E. Osnovnye cherty struktury Srednego Timana. (Moskovskoe obshchestvo ispytatelel prirody. Bûlleten', 1945. god 116. Otdel geologicheskii. t. 20, no. 5–6, p. 55–73, text map, table, diagrs.) 43 refs. Text in Russian. Summary in English. Title tr.: Basic features of central Timan structure.

Contains review of early investigations supplemented by recent data on the structure of the Timan Ridge (64° N. 52° E.). Main attention is given to study of the morphology and genesis of the structures, particularly to the metamorphic Precambrian foundation of the Ridge and the thinner more disintegrated Devonian and Carboniferous formations on top. The structure has block form. The sloping layers confined by flexures, indicate that the Timan structure was formed as result of vertical movements. The small domes located close to the flexures often contain gas and oil.

47149. OGNEVA, T. A. Nekotorye osobennosti teplovogo balansa de@atel'-nol poverkhnosti; po materialam nabl@denil v Koltushakh. Leningrad, Gidrometeorologicheskoe izd-vo, 1955. 120 p. (Glavna@ geofizicheska@ observatori@ im. A. I. Voelkova.) Illus., graphs, tables. 114 refs. Text in Russian. Title tr.: Specific features in heat balance on an active surface; on observations at Koltushi.

Theory of heat balance and practical methods of computing it are described on the basis of daily and seasonal observations on temperature gradient, humidity and wind velocity carried out for five years. The heat balance is discussed in respect to the variations of its components at different periods, such as radiant energy of the sun, heat of evaporation, ground heat and that of turbulent air flow. The results and conclusions are applicable in scientific work and in solution of practical problems in agriculture and construction under winter or permafrost conditions. Copy seen: DLC.

47150. OGONËK. ÎAkutskiî pisatel'. (Ogonëk, Sept. 1956. god 34, no. 40, p. 30, port.) Text in Russian. Title tr.: A Yakut author.

47153. OINONEN, EINO A. Kallioiden muurahaisista ja niiden osuudesta kallioiden metsittymiseen Etelä-Suomessa. Helsinki, 1956. 212 p. illus., tables, maps. (Acta entomologica fennica, v. 12.) About 100 refs. Text in Finnish. Summary in English, p. 179–212. Title tr.: The ants of the rocks and their contribution to the afforestation of rocks in southern Finland.

Author, having observed many vigorously growing pine seedlings on earth mounds built by ants on rocks, studied the ants and ant ecology in southern Finland and, for comparison, those of similar locations in Lapland. In addition, tree stumps were studied in Lapland to elucidate the ant's choice of nests. Further investigations included determinations of the proportion of trees originating from ant hills on rocks; differences between these trees and those in other places; reasons for the formation of seedlings in ant hills and for their good growth; etc.

Hope, for Canadian Defence Research Board, Directorate of Scientific Information Service, Sept. 1956, no. T228R. (3 p. illus., graphs.) Copy at CaMAI. Title tr.: Seasonal distribution of shortperiod oscillations of the terrestrial electro-magnetic field.

Two typical microvariations in the terrestrial electromagnetic field among large bands of frequencies differing in amplitudes and shapes are described with recorded oscillations. One represents continuous oscillation during many hours with 10-40 sec. periodic changes; the other, one or a few short trains with damping oscillation. Both records were made at the Alma-Ata

station, Sept. 1953-Aug. 1954 and were statistically processed to frequency diagrams of annual variation. Maximum frequency is associated with vernal and autumnal equinox, and minimum with winter or summer solstice. Both frequencies vary with zonality of sun-spot distribution and mutual location of solar and terrestrial equatorial planes. In an equinoctial period, the earth's surface is subjected to action of the corpuscular stream, emitted by the sun-spots, but in a solstitial period, much less so, since the terrestrial and solar equatorial planes are under 23°37' angle to each other. Copy seen: DLC.

47158. OKKO, VEIKKO OMA TOIVO, 1912- . Glacial drift in Iceland, its origin and morphology. Helsinki, 1955. 133 p. 53 illus. incl. 32 on 16 plates, 3 text maps, diagrs., crosssections, graphs, tables. (Finland. Geologinen Tutkimuslaitos. Bulletin, no.

170.)Approx. 150 refs.

Includes (p. 112-22) a comparison of the present temperate glaciers of Iceland with the sub-polar and high polar glaciers of Jan Mayen, Vestpitsbergen and Nordaustlandet, Baffin Island (Barnes icecap), Greenland (inland ice and outlet glaciers, especially Eqe on the west coast), and the southern coast of Alaska. Size, type (based on morphological characteristies and climate), thickness, and regime are compared; also glacial deposits. Copy seen: DGS.

47159. OKLADNIKOV. ALEKSEĬ PAVLOVICH, 1908- . Drevnee nase-Sibiri i ego kul'tura. (In: Akademifa nauk SSSR. Institut etnografii. Narody Sibiri. 1956. p. 21-107, illus., fold. maps.) 25 refs. Text in Title tr.: The ancient popula-Russian. tion of Siberia and its culture.

Gives a chronological outline of the stone and metal age cultures, including: the early Magdalenian finds at Buret' (Angara basin) and Mal'ta (Belaya River); the late paleolithic sites on the Yenisey, Angara and Lena Rivers as far north as Olekminsk and Markhachan (61° N. 121°-123° E.); the neolithic cultures of the Angara, Lena and Baykal regions (Isakov: approx. 4000 B. C.; Serov: 4th-3rd millenium B. C.; Kitoy: 3rd-early 2nd millenium B. C.; and Glazkov: 1800-1300 marking the beginning of metal). Outline continues with the late neolithic cultures on the middle and lower Lena and Ob' Rivers and in central Chukotka (2nd-1st millenium B. C.); and the bronze age cultures of the Yenisev River area (Afanas'ev: 3rd-2nd millenium B. C.; Andronov: 1500-1200 B. C.; and Karasuk: 1300-800 B. C.). The stone, bone and metal artifacts, ceramics, ornaments, etc., are described and the paleolithic and neolithic sites shown on separate maps. The culture, customs, trades, clothing and housing of prehistoric men in Siberia are discussed, also their race affiliation (Mongoloid), inter-relationship, and their northern expansion. A puzzling occurrence of paleolithic and neolithic implements within the same culture horizons in the Lena, Angara and Yenisey sites is noted, and various proposed explanations (stagnation, foreign influence, poor quality of stone) are rejected. Author suggests a locally accelerated evolution, conditioned by the specific needs of the native economy and by the progressive technique of a late-paleolithic Mongolian-Siberian culture. 47160. OKLADNIKOV, ALEKSEĬ PAV-LOVICH, 1908- . Lenskie drevnosti, vyp. 2. Otchet ob arkheologicheskikh issledovaniakh na nizhnel Lene ot Zhiganska do Kumakh-Surta v 1942-1943 gg. Yakutsk, 1946. 187 p. illus., maps, plans, diagrs., tables. Approx. 45 refs. (Akademifa nauk SSSR. Institut istorii material'noï kul'tury. Nauchno-issledovateľskiľ institut ſazyka, literatury i istorii ÎAASSR.) Text in Russian. Summary in English. Title tr.: The Lena antiquities, part 2. Report on archeological investigations along the lower Lena from Zhigansk to Kumakh-Surt in 1942-1943.

Contains results of the Lena historicalarcheological expedition of the Institute of Material Culture of the Academy of Sciences U. S. S. R. and the Scientificresearch Institute of Language, Literature and History of Yakut A. S. S. R. (pt. 1, 3 of these results were listed as No. 24814, 31086.) The geography, geology, geomorphology, flora, soil formation (peat), etc. of the Lena valley, 600 km. from Zhigansk (66°45′ N. 123°20′ E.) to the delta, are discussed. The burials, sunken earth-houses, temporary and permanent camps, workshops, hearths, ceramics, and stone, bronze and iron artifacts of the forest and forest-tundra zone are described in detail; the finds are tabulated. The excavated sites are divided roughly into two groups: the first, centering around Lake Uolba, near Zhigansk, belonged to semi-settled fishermen, while the second, near Bulun (70°50' N. 127°12' E.) is typified by camp sites of nomad hunters. Though both culture centers were inhabited from the stone through the iron age, the majority of the excavated sites (80 of 137), including those dealt with in pt. 1 (No. 24814) and enumerated in pt. 2, p. 132-36, have neolithic implements or artifacts bearing traces of having been made with stone tools. The earliest neolithic finds in the Uolba Lake region, are similar to, though younger than those of Yuzhnyy Oleniy Ostrov in Lake Onega, Karelia: the prone ochre-covered skeleton oriented toward the NE, the shape and flaking technique of the tanged arrowheads, lamellar blades, etc. While artifacts of black flint-slate predominate in the lower layers, implements made of various materials including (p. 142) petrified wood were found in the upper neolithic layers. The large number of nuclei, flint flakes, and half-finished artifacts in the Bulun camp area, particularly near Chukurovka (i. e. Chekurovka? approx. 71°10′ N. 127° E.), and Siktyakh (69°55′ N. 125°15′ E.) point to their use as workshops by the nomad hunters. Knife blades (including the so-called man's knife also found in North America, p. 145), spear and arrow heads, potsherds, bone fragments, etc., were found. A perforated plug (vtulka, pl. xv) made of reindeer horn, probably used to hold the blade of an axe or adze, is compared to similar Eskimo artifacts found in northeast Asia and polar regions of America (p. 90-91). Of particular interest are the bronze finds made throughout the valley as far north as Chukurovka and often found together with stone artifacts of very archaic type. The discovery of earthenware pots and spoons used in copper and bronze smelting prove the existence of local bronze production. Though no attempts at exact dating are made, comparisons are drawn throughout with finds on the Middle Lena and Angara Rivers, Lake Baykal and Onega, etc., and the similarity between the northern Lena bronze stage and the Glaskov culture of the Baykal region (1700-1000 B. C.) is noted. Iron artifacts manufactured from local ore deposits were found in the uppermost layers and show a slow transition from late bronze to early iron age. Traces of a later stage of the early iron age characterized by an almost total absence of stone implements

were also discovered in the lower Lena region. The latest finds belong to the so-called "small house" culture which existed up to the 16th-17th-century A. D. The more important finds (including a bronze age burial with skeleton and tools in their original positions), plans of two excavation sites, soil profiles, and sketch maps of the lower Lena valley and the Lake Uolba complex, are appended (p. 159-82); also (p. 183-86) a summary in Yakut and in English. Copy seen: PU.

47161. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908— Vklad sovetskol arkheologii v izuchenie proshlogo severnykh narodov. (Leningrad Universitet. Uchenye zapiski, no. 115, 1950. Fakul'tet narodov Severa, vyp, 1, p. 22–37.) 4 refs. Text in Russian. Title tr.: Contributions of Soviet archeology to the study of northern peoples.

Russian archeological and ethnological investigations of the 17–19th centuries are outlined; the work and conclusions of Soviet scientists are reviewed on prehistoric distribution, ethnic affiliation, cultural connections and artistic development of peoples inhabiting the northern part of Europe and Asia during the stone, bronze, and early iron ages. Eskimo culture of the Bering Strait and its study by Hrdlička, Collins, Bogoraz and Rudenko are discussed. Paper delivered to the Northern Conference at Leningrad University, Dec. 10–14, 1947.

maps, tables.) 74 refs.

Cambrian formations of western Mackenzie District, Yukon, and easternmost Alaska outcrop within the central and eastern sections of the northern Cordilleran region. The central system includes the Yukon Plateau, and the Ogilvie, Selwyn, and Pelly Mts.; the eastern system includes the Richardson, Mackenzie, Franklin, and Rocky Mts. The region was occupied by the sea for long periods during Late Proterozoic to Silurian time. As information is scarce on the outcrops, various parts of the Cambrian have not been differentiated in many areas: it is treated as a whole for Yukon, Alaska, and Northwest Territories in turn (p. 723-28), and outcrops of Lower, Middle and Upper Cambrian noted where age is definitely known. Copy seen: DGS.

Text in Danish. Title tr.: The Greenlanders' friend: Hinrich Rink, scientist, writer and Greenland administrator.

Biography of Hinrich Johannes Rink (1819-1893), based in part on newly found material. After studies in the natural sciences, Rink went to Greenland in 1848 to carry out mineralogical and geological investigations, one result of which was his Om isens udbredning og bevægelse over Nordgrønlands fastland (On the extension and movement of the ice across the North Greenland mainland), published in 1853. Rink was factor in Godthåb and inspector in southern Greenland 1855-1868. His work towards local government and in founding the printing works at Godthåb is stressed, and his numerous publications are treated During 1871-1882, he was in detail. director of the Greenland trade and administration, then resigned due to differences with authorities.

Appended (p. 45-93) is Rink's report of an inspection trip to Greenland in 1872. Copy seen: CaMAI.

Brief introduction is followed by tabular data covering all drainage basins over 200 km.2: size of main and tributary areas, percentage of area in lakes, area of lakes, number, and names of lakes over 1 km.2 Summary tables (2) relate the general survey maps of the country to latitude and regions covered in this study. Base map is in scale 1:1 million for southern and 1:2 million for northern Finland.

47169. OLIVER, DONALD RAYMOND. Interim report to the Arctic Institute of North America on the limnological investigation of Nettilling Lake, Baffin Island, 1956; with additional notes on the birds, mammals, insects and plants. [Montreal, 1956.] 9 p. 2 text maps, 3 graphs. Mimeographed.

Course of the expedition and field work in the area 66°30′ N. 70°50′ W. by the author and J. A. Thomson, May 10–Sept. 16, is recounted. Ice thickness measurements, observations of water temperature and oxygen content are presented; fish plankton and bottom fauna taken are described; qualitative collecting was carried out in streams and ponds near edge of lake. Mammals and birds were noted, and approx. 300 insect specimens collected including one order (Coleoptera) and several families new to Baffin. Fifty plants were collected.

47170. OLIVER, DONALD RAYMOND. Limnological investigations in northern Quebec. (Arctic, 1955, pub. 1956. v.8, no. 4, p. 261.) Fresh-water investigations were made in the Lac Aigneau District, Koksoak River basin, about 85 mi. southwest of Ft. Chimo, by the writer and G. Power. The latter studied life history and physiology of the salmonoid fishes (brook trout, land-locked salmon, arctic char). The writer made soundings in the lake, took temperature, oxygen, and pH determinations, sampled plankton and bottom fauna, and made overnight net sets with gill nets. Copy seen: DLC.

47171. OLIVER, THOMAS A., 1924—. Geology of the Counsell Lake and Wilmot Lake areas, Granville Lake division, Manitoba. Winnipeg, Queen's Printer, 1952. 28 p. 6 illus., 2 fold. maps (30 x 42 in.), table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 50–9.) 3 refs.

Maps (scale 1 in: ½ mi.) cover the 56°30'-45' N. 101°00'-30' Counsell Lake is about 12 mi. south of Lynn Lake mining district. Field work was carried out in summers 1949 and 1950. Topography, drainage, and surconditions are described. solidated rocks are Precambrian. The Archean Wasekwan series of interbedded volcanics, pyroclastics, and sediments, locally highly metamorphosed by later intrusions, is overlain by the Sickle series of clastic sediments. A group of metamorphic rocks in the Wilmot Lake area, termed Kisseynew-type gneiss, is apparently derived from metamorphosed Sickle sediments. Intrusive rocks ranging from gabbro to granite also occur. Structural geology is briefly described. No abundance of glacial drift, muskeg, and water hinders prospecting.

winter masonry.

Progress in brick construction during winter and summer seasons is described on the basis of observation of actual construction, coordinated experiments and laboratory analyses. In the first part (no. 11) the widely adopted "freezing method" is discussed: construction of brick walls with slightly heated cement mortar, which freezes in a few hours and remains frozen during construction until the first thaw, when final hardening takes place. Various details of construction and damage from sudden thawing of the frozen mortar in the overstrained brick structure are analyzed, with suggestions for prevention. Regular check is required on stresses developed in the lower part of the wall from rapid construction of the upper structure, and from variation in air temperatures and in degree of hardening of the mortar. Comparative data are tabulated and graphically presented. In the sequel (no. 12), a modified "semifreezing method" is explained as better suited to rapid construction of multistory buildings: the stories below actual construction are artificially heated above freezing temperature to speed the hardening process (especially in the inner part of the walls) before the load of the upper structure is appreciably increased. Frost penetration in the wall and stress variations are regularly checked in removable brick and mortar samples. Jan.-May data are charted (no. 12, p. 19) with the five-day average air temperatures. structive loads and stresses are tabulated for walls and columns of different sizes and types of structure. Average reduction of strength of masonry due to freezing varies with temperature: from 100 percent at 0° C. to 53.6 percent at -30° C., therefore the safety factor should be increased in designs for winter construction. Suggestions for successful winter construction are offered; pre-fabricated brick wall blocks made in heated or frozen conditions; masonry with fast-hardening mortar; and use of anti-freezing additives (NaCl and CaCl2) in the mortar.

47187. OOSTEROM, M. G. Some notes on the Lille Kufjord layered gabbro, Seiland, Finnmark, northern Norway. (Norway. Norges geologiske undersøkelse, 1956. nr. 195, Årbok 1955, p. 73–87, illus., text map, sections, tables.) 12 refs. Text in English. Summary in Norwegian.

In summer 1953, investigations were made of a layered complex of gabbroic composition with intercalated peridotite bands on the island of Seiland (70°25' N. 23°15' E.) by a Norwegian Geological Survey expedition led by T. F. W. Barth (cf. No. 33466). The complex is bounded on the west by garnet gneisses (whose foliation has the same orientation as the layering in the basic rocks) and on the northeast by basic granulites. Unlike other known layered complexes, which contain ultrabasic rocks at the base and less mafic rocks at the top, here ultrabasic and basic rock types are interlayered. Layering disappears gradually in the southern part of the occurrence. Rock components of the complex, ore mineralization, and chemical analyses of trace elements are discussed. No economic concentrations of ore minerals were found. Copy seen: DGS.

Text in Russian. Title tr.: Experience in the use of seismic exploration at Kuybyshev, on the bank of the Volga under winter conditions.

Winter geophysical explorations of this region with numerous water bodies (lakes, rivers, marshes, ponds, etc.) are described in detail, as guidance in work in northern Siberia, the Far East and other regions not easily accessible in summer. The working outfit comprises a seismic station of type SS-51-D-F, with a seismograph type SP-16 and velocity filter, placed in a heated and wellinsulated shed installed on sleds; five well drillers (type AVB-T) on a tractor; one snake driller (BS-3A), water and oil tanks also in heated sheds. Selection of the exploration site, setting up the equipment with protection against snow drift and wind, work procedures, maintenance of communication lines, and other details are described on the basis of three winters' (1952/53-1954/55) experience.

Contains abstract of paper presented at the 52nd Annual Meeting of the Association, Montreal, Apr. 1–5, 1956. The Carnegie Corporation of New York made a grant to McGill University and the Montreal Office of the Arctic Institute in 1951, for arctic studies, in a five-yr. period. With scholarships 34 students from seven countries have worked in Canada (mainly), Alaska and Greenland. Studies in botany, geography, geology, parasitology, sociology, anthropology, zoology have been carried out. Copy seen: DGS.

47202. ORVIN, ANDERS KRISTIAN, 1889– . Expeditionen des Norsk Polarinstitutt nach Svalbard, Jan Mayen und Ostgrönland in den Jahren 1953 und 1954. (Polarforschung, 1954, pub. 1956. Bd. 3, Heft 1–2, Jahrg. 24, p. 299–300.) Text in German. Title tr.: Expeditions of the Norsk Polarinstitutt to Svalbard, Jan Mayen and East Greenland in the years 1953 and 1954.

Hydrographic soundings of the coastal waters near Jan Mayen were continued in 1953 and 1954, but no scientific or topographic units were sent to Svalbard in 1953. The annual relief expeditions to Myggbukta Radio and the Norwegian hunting grounds in northeast Greenland were continued in both years. A scientific expedition of 30 men conducted hydrographic, topographic, geological, glaciological, and ornithological investigations on Svalbard from June–Aug. 1954.

Charles Borden's excavations in the Fraser delta (British Columbia) area are They brought to light an discussed. early occupation with traits of Eskimoid culture which he terms Early Maritime. His attribution of traits in the following period to the Interior (Athabascan hinterland) is examined and evaluated: the writers take issue with Borden's hypothesis of an Interior influence on the Coastal culture. The relationship between the Eskimoid or Early Maritime culture of the Fraser delta and northern Eskimo cultures (Okvik, Paleo-Aleut, Kachemak Bay I) finds is analyzed, and a wider and earlier circumpolar culture pattern sug-Copy seen: DLC. gested.

Fisheries and reindeer breeding are the main occupations of over 1,600 seminomadic Lapps on Kola Peninsula, who are making only the first steps in vegetable growing and livestock raising. Loans are made through five loan associations. In 1925–27, over 11,000 rubles were disbursed to 94 households with 397 persons, mostly belonging to the poorest of the population; 6,408 r. were lent for reindeer breeding, with the average price of reindeer, 20 r./head; 3,020 r. went for

fisheries development; 880 r. for purchase of cows. The loans granted for nine months to three years, averaged at 121 r. The Lapps' regular repayment of debts is noted.

The complex bottom structure of the Arctic Basin and ice conditions in the Central Arctic are reviewed briefly. An

extensive range of submarine mountains was discovered in 1948 extending from the New Siberian Islands to the North Pole and beyond towards Greenland. This range, named the Lomonosov Chain, divides the Arctic Ocean into the western or Atlantic part and the eastern or Pacific part. The Pacific portion of the Central Arctic contains old ice fields which move in a nearly-closed circulation with little change in thickness. Ice in the Atlantic section is younger ice (2–3 yrs. old) and moves in an irregular pattern, finally emptying into the Greenland Sea.

47226. PAGE, WILLIAM B. Design of water distribution systems for arctic regions. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 56-61, diagrs., tables.) 7 refs.

Studies were conducted to determine whether water circulation could be maintained through a house service pipe constructed as a loop with both ends attached to a single water main by a special fixture (called a pitorifice), and to compare the efficiency of pitorifices which could be fabricated easily and economically. The observations involved making a series of simultaneous measurements of the velocity in the model main and service pipes. The efficiency of various pitorifices was compared by plotting the relationship between the velocity in the main and the velocity in the service pipe for each individual pitorifice. Preliminary calculations indicate that a main velocity of 2 ft./sec. is feasible to maintain and that freezing will be prevented in the service pipes by the velocity of 0.17 ft./sec.

A mathematical expression for heat loss from buried water and sewer lines is developed based on a series of measurements made in Fairbanks. A graph is given for estimating the heat loss in Btu/hr. linear ft. of pipe for a temperature gradient of 0-9° F. measured in the soil 12 in. radially from the pipe wall and for pipes with outside diameter of 1 to 32 inches. The estimate can be expected to have an accuracy within 25 percent.

47228. PAIGE, RUSSELL A. Subglacial stoping or block caving: a type of glacier ablation. (Journal of glaciology, Oct. 1956. v. 2, no. 20, p. 727–29, 7 illus.) 3 refs.

Describes an unusual method of glacier retreat observed in April and September on Black Rapids Glacier, Alaska Range, 63°31′ N. 145°53′ W. The center of the terminal area recedes the most rapidly because of a meandering subglacial river that accelerates melting of its sides. Lateral melting of the ice on the convex side of the meanders weakens the ice roof and causes a series of concentric, crescent-shaped crevasses to form on the glacier surface. This caving-in and lateral melting has been termed "subglacial stoping" or "block caving" by J. G. McCall.—From SIPRE.

Title tr: Expedition of Lieutenant
Pakhtusov to the eastern coast of
Novaya Zemlya in 1832 and 1833.

Reprinted in No. 47229.

Contains the basic materials on the first Pakhtusov expedition, sponsored by a company of Russian merchants headed by Klokov; it was to explore the shores of Novaya Zemlya and attempt a voyage to the Yenisey River mouth. The party left Arkhangel'sk on Aug. 1, 1832 with two vessels, the Novaia Zemlia under command of Pakhtusov, and the Eniset under his aide, Lieutenant Krotov; on Aug. 9, the vessels were separated and the Eniset was never seen again. Left with but ten men. Pakhtusov surveyed the southern coasts of the southern island of Novaya Zemlya till the advanced season forced him to winter in an old hunters' hut at Kamenka Bay (70°36' N. 57°25' Work was resumed in July 1833, and Pakhtusov succeeded in describing the eastern coast of southern island up to Matochkin Shar Strait. Though ice conditions were favorable for further penetration northward or eastward, Pakhtusov was forced to turn back by the poor health of his men. The Novaia Zemlia reached the Pechora River mouth and from there Pakhtusov traveled on reindeer sled to Arkhangel'sk (Nov. 21). Two of his men had died during the wintering and a third on the voyage home. Pakhtusov's diary, Aug. 1, 1832-Sept. 5, 1833 (p. 20-201) records the events of the expedition, its work, hunting, hardships, etc.; his summary of its results are appended (p. 202-220) with

remarks on the climate, geomorphology, soils and hydrography, also the minerals, vegetation and wildlife: birds, insects, land and sea animals, etc. Pakhtusov's instructions from the sponsor of the expedition are included (p. 220-44). Debris of a vessel found 1834-35 on the shores of Novaya Zemlya is reported as that of the Eniset. Editor's (M. F. Refneke?) introduction (p. 1-19) reviews previous expeditions to these islands and presents Pakhtusov's statement of his objectives. The map compiled by Pakhtusov of the southeastern part of Novaya Zemlya and Matochkin Shar, is inserted at the end of the volume.

Copy seen: DLC.

47231. PAKHTUSOV, PETR KUZ'-MICH, 1799–1835. Vtorafà ékspedi fsifa podporuchika Pakhtusova k vostochnomu beregu Novoĭ Zemli v 1834 i 1835 godakh. (U. S. R. Gidrograficheskiĭ departament. Zapiski, chast' 2, 1844, p. 1–163, tables incl., 1 fold., fold. map.) Text in Russian. Title tr.: The second expedition of Lieutenant Pakhtusov to the eastern coast of Novaya Zemlya in 1834 and 1835. Reprinted in No. 47229.

After return from his first expedition in 1833, Pakhtusov suggested another to complete description of the eastern coasts of Novaya Zemlya. It was sponsored by the Russian Hydrographic Dept., and Pakhtusov, with A. K. TSivol'ka secondin-command, headed a 17-man party from Arkhangel'sk on July 24, 1834, on the schooner Krotov and a hunters' boat (karbas) Kozakov. They reached Matochkin Shar on Sept. 6th, and in view of the advanced season, wintered on the southern shore of the strait, at the mouth of Chirakina River (73°17′ N. 54°21′ E.). In the spring, a sled party headed by TSivol'ka explored the eastern coasts of the northern island up to Cape Flotova, 150 km. north of Matochkin Shar; Neznayemyy and Medvezhiy Bays were discovered and the coast visually surveyed. When ice conditions permitted, Pakhtusov sailed the Kozakov northward along the western coast aiming to round Cape Zhelaniya. He reached the Gorbovy Islands (75°55' N. 59°00' E.) where the boat was wrecked, and the party rescued by Russian hunters and returned to winter camp. Pakhtusov subsequently made a boat trip along eastern shores, reached 74°24' N. and discovered a group of islands which now bears his name. further advance northward

blocked by heavy ice, Pakhtusov turned about and reached Arkhangel'sk at the beginning of October. Two of his men died during the expedition, and a month after return, Pakhtusov himself died.

Pakhtusov's diary, May 1834-Oct. 7, 1835 is presented (p. 9-81), preceded by text of his instructions from the Hydrographic Dept. Appended are the scientific results of both expeditions as worked up by the editor, M. F. Reĭneke from Pakhtusov and TSivol'ka's notes: a summary, notes on the coastal features and a hydrographic description of the places visited (p. 82-115). A glossary of terms used by hunters of Arkhangel'sk Province is given (p. 115-29). Data are presented (p. 130-63) of the astronomical, geomagnetic and tidal observations carried out 1832-35. Fold, map of Novaya Zemlya (at end of vol.) is based in part on Pakhtusov's work. A sketch of his life, signed S. K., is also given, p. 412-19. Copy seen: DLC.

General description is given of a bog in an inundated forested area in Arvidsjaur district in Swedish Lapland, together with a simple list of 135 coleopterous species collected in the summer of 1955. \*\*Copy seen: DLC.

47235. PALM, THURE, 1894—. Systenocerus caraboides L. och cribratus Muls.; Col., Lucanidae. (Entomologisk tidskrift, June 1956. Årg. 77, häfte 1, p. 19–24, 2 illus.) 2 refs. Text in Swedish. Summary in German. Title tr.: Systenocerus caraboides L. and cribratus Muls.; Col., Lucanidae.

Contains a comparative taxonomic study of these two species, of which S. caraboides occurs in the Kihlangi and Pajala regions of Norrbotten, Sweden. A new name, Platycerus caraboides, is proposed.

Copy seen: DLC.

47236. PALM, THURE, 1894—. Zur Kenntnis der Biologie von Acmaeops pratensis Laich. und verwandten Arten; Col., Cerambycidae. (Opuscula entomologica, 1956. bd. 21, häfte 2–3, p. 233–45, 21 illus.) 2 refs. Text in German. Title tr.: Contribution to knowledge of the biology of Acmaeops pratensis Laich. and related species; Col., Cerambycidae.

Contains a key to mature larvae of three species of Acmaeops, and observations on the metamorphosis and life cycle of pupae and larvae of these cerambycids in Torne and Lycksele Lappmark; measurements of larvae in various stages of their development are given.

Copy seen: DSI.

47237. PALMA, G., and others. Studio dell' influenza dei tessuti periferici sui microchiloni del siero. 3; variazioni dello scarto artero-venoso postprandiale dei microchiloni per effetto di stimolazioni termiche distrettuali (caldo e freddo). (Società italiana di biologia sperimentale. Bolletino, 1956. v. 32, no. 6, p. 334-37, illus., tables.) Text in Italian. Other authors: C. Cordova and C. D'Arrigo. Title tr: Study on the influence of the peripheral tissues upon the chylomicrons of serum. 3: variations in the arteriovenous postprandial discharge of chylomicrons under the effect of thermal distress stimuli (heat and cold).

Includes observations on conditions in dogs made locally hypothermic by application of an ice-filled sleeve to the studied area. The fluctuation in both the arterial and venous vessels was too small to be attributed with certainty to the cold stimulus. Copy seen: DNLM.

47238. PALMÉN, ERNST. Eräitä mielenkiintoisia kovakuoriaislöytöjä. (Suomen hyönteistieteellinen aikakauskirja, 1940. v. 6, no. 3, p. 80–82.) Text in Finnish. Summary in German. *Title tr:* Some interesting beetle finds.

Contains distributional data on eleven species inhabiting Finland, among them Trachypachys zetterstedti in the Kuusamo region (Salla) and Finnish Lapland.

Copy seen: DLC.

47239. PALMÉN, ERNST. Eine östliche Philonthus-Art, Ph. diversipennis Bernh. (Col., Staphylinidae) aus Finnland nebst Bemerkungen über zwei andere für die Fauna Finnlands neue Käferarten. (Suomen hyönteistieteellinen aikakauskirja, 1938. v. 4, no. 1, p. 43-47, 2 illus.) 10 refs. Text in German. Title tr: An eastern Philonthus species, Ph. diversipennis Bernh. (Col., Staphylinidae), with remarks on two others new to the beetle fauna of Finland.

Includes a re-description of Ph. diversipennis, a species known previously from the Kola Peninsula and Pechora River basin of northern U. S. S. R. Copy seen: DLC.

47240. PALMÉN, ERNST. Zur Systematik finnischer Chrysomeliden, 1. Gattung Galerucella Crotch. (Suomen hyönteistieteellinen aikakauskirja, 1945, v. 11, no. 2, p. 140–47, 4 illus., 6 text maps.) 10 refs. Text in German. Title tr: Contributions to the systematics of Finnish Chrysomelidae, 1; the genus Galerucella Crotch.

Contains discussion of this genus, a key to Fennoscandian species and distributional data on six; among them: G. nymphaeae (all Fennoscandia to the arctic coast), G. lineola (Utsjoki, Finnish Lapland). This is the first of a series of papers on the leaf-beetle family, no. 2-4 infra.

Copy seen: DLC.

47241. PALMÉN, ERNST. Zur Systematik finnischer Chrysomeliden, 2; Taxonomisches und Zoogeographisches über Phyllodecta boparis [i. e. polaris] Sp.-Schn. (Suomen hyönteistieteellinen aikakauskirja, 1945. v. 11, no. 3, p.

196–203, 6 illus., text map.) 9 refs. Text in German. *Title tr:* Contributions to the systematics of Finnish Chrysomelidae, 2; taxonomy and zoogeography of *Phyllodecta polaris* Sp.–Schn.

This paleo-boreal beetle, ranging from middle Scandinavia to Iceland, is not an arctic, even less a western arctic species. In Fennoscandia it is distributed in Kola Peninsula, and in Finnish Lapland.

Copy seen: DLC.

47242. PALMÉN, ERNST. Zur Systematik finnischer Chrysomeliden, 3; Untergattung Phytodecta s. str. (Suomen hyönteistieteellinen aikakauskirja, 1945, v. 11, no. 4, p. 227-34, 11 illus., 2 text maps.) 10 refs. Text in German. Title tr: Contributions to the systematics of Finnish Chrysomelidae, 3; the subgenus Phytodecta s. str.

Contains a critical revision of this coleopterous subgenus, comprising six Fennoscandian species. Included are P. sundmani (Jacobs.) n. sp., based on specimens from the lower Yenisey (type), the Lena River, Ayan on the Okhotsk seacoast, and eastern Karelia; and P. norvegicus from the Lena River, eastern Siberia, and the Kuusamo-Inari region in Finnish Lapland. Copy seen: DLC.

47243. PALMÉN, ERNST. Zur Systematik finnischer Chrysomeliden, 4; Phytodecta (Goniomena) quinquepunctatus F. und Ph. intermedius Hellies. (Suomen hyönteistieteellinen aikakauskirja, 1948. v. 14, no. 1, p. 1–10, 4 illus., 2 text maps.) 8 refs. Text in German. Title tr.: Contributions to the systematics of Finnish Chrysomelidae, 4; Phytodecta (Goniomena) quinquepunctatus F. and Ph. intermedius Hellies.

Critical, comparative study of the taxonomy and Scandinavian distribution of these two species, both occurring in northern Scandinavia and Kola Peninsula. Their origin and spreading in Scandinavia are discussed.

47248. PANOFSKY, HANS A. Theories of climatic change. (Weatherwise, Dec. 1956. v. 9, no. 6, p. 183–87, 204, diagr., graphs.)

Summarizes the more important theories of climatic change, grouped as earth's crust, atmospheric, and astronomical theories, stressing the last (variations of solar activity, effects of orbital changes). Objections to the orbital theory are noted; many of the theories described can account for climatic changes, but writer prefers that based on earth's orbital changes plus mountain building.

no. 6, p. 105-114, illus.)

Describes experiments in freezing fowl and cattle sperm and human red blood cells, making possible long-term storage and preservation of such cells; also the freezing and subsequent successful revival of rats and a hamster.

Copy seen: DGS.

PARKES, ALAN STERLING, 47255. 1900- . Grafting of mouse ovarian tissue after freezing and thawing. (Journal of endocrinology, Nov. 1956. v. 14, no. 3, p. xxx-xxxi.) ref.

Report on experiments with miceovaries autografted subcutaneously after freezing to -79° C. and thawing. Freezing in 15 percent glycerol horse serum did not significantly change the proportion of grafts taking or the duration of their activity, as compared with controls; on the other hand freezing in glycerol saline was very damaging, and no grafts were obtained from tissue frozen for one day. Copy seen: DNLM.

PARKES, ALAN STERLING, 47256. 1900- . Preservation of living cells at low temperature. (Lectures on the scientific basis of medicine, 1952-53. v. 2, p. 250-62, illus. tables.) 31 refs.

A review of recent research into freezing and thawing of cells, mainly of mammals, and their storage at low temperatures. Freezing and survival of spermatozoa from different animals in various solutions, behavior of erythrocytes, fertilized ova, endocrine tissue, testis, etc., under similar conditions and microscopical observations on freezing are also discussed. Copy seen: DNLM.

47257. PARKHOMENKO, S. G. Zamerzanie pochv i rykhlykh gornykh porod. (In: Akademifa nauk SSSR. Institut merzlotovedenia. Materialy k osnovam uchenifa o merzlykh zonakh zemnol kory, 1956. vyp. 3, p. 40-84,

illus., graphs, tables.) 51 refs. Text in Russian. Title tr.: Freezing of soils

and porous rocks.

The effects of the water phase on processes in ground freezing are analyzed, and investigations since 1861 related to the problem are reviewed in detail. Water in the solid state is considered the most important for permafrostology because the maximum variations in frozen ground structure occur with the freezing of gravitational, capillary, and hygroscopic water. These transformations also cause different thermal effects, water migration, microseismic oscillations, and changes in ground volume. A study of freezing and thawing processes in rock formations in soil was conducted in Yakutia with special attention to volumetric variation of the ground (swelling), the magnitude and periodicity of which are shown on graphs (p. 48). Conditions of the molecular layer of hygroscopic water and its solutions are outlined and pressure within a monomolecular layer is estimated of order 100,000 kg./cm.2 Freezing of hygroscopic water within a porous clay, was not obtained even at temperature -78° C. Theoretical considerations, illustrated with a phase transformation diagram (p. 59), are given in discussion of the mechanism of crystallization soil and rock solution. Data on basic points of equilibrium of water and five forms of ice are presented in table (p. 60). Major points of the discussion are summarized in conclusion (p. 78-81).

47261. PARRISH, B. B. The cod, haddock and hake. (*In*: Graham, M. Sea fisheries, 1956, p. 251–331, illus., tables, maps.)

A comprehensive study of the biology and fishery of the three species, the first two of them caught largely in subarctic and arctic waters. Information is presented on the stocks and their distribution, including commercial statistics, research, overfishing, distribution and biology of the three species, character of stocks. Studies of the stocks deal with: age- and life history; spawning, seasons and shoals; early development; demersal stage; growth and growth analysis; recruitment to stock; fishery and landings; other aspects of recruitment; calculation of mortality. Copy seen: DLC.

47262. PARSHLEY, MARY STEARNS, 1912-, and R. A. DETERLING. Tissue culture studies of blood vessel grafts, 2; the effect of storage at low temperatures on growth in vitro of adult dog aorta. (American journal of anatomy, Nov. 1955, v. 97, no. 3, p. 359-89, illus., table) 63 refs.

Contains a study of outgrowth in tissue culture from aorta sections frozen in 10 percent serum or dextrose at -72° C. and stored in a CO<sub>2</sub> chest at about -70° C., as compared with similar sections planted immediately or after storage at 4° C. Some cells and explants survived freezing and thawing and there was an increased lag period as compared with that of fresh tissue. Storage at -70° C. also caused a significantly greater loss of viability than at 4° C. Part 1 of this study deals with the

cultivation of similar, but not frozen, tissue. Copy seen: DNLM.

47271. PATERSON, STEN STURE. Anthropogeographical studies among the Jokkmokk mountain Lapps. Göteborg, 1956. 64 p. 17 illus., 2 graphs, diagr., 4 text maps. (Göteborgs k. vetenskapsoch vitterhets- samhälle. Handlingar, 6. följden, ser. A, bd. 6, no. 2) 38 refs.

Study of change in economic and connected social forms among these Lapps, with innovations from Swedish culture, stronger both numerically and technically. Based on field work in summers of 1943-1945. Physical conditions in Jokkmokk parish, its reindeer ranges, kinds, development and present handling of the animals, work in the camps, and future of herding are considered in turn. Natural conditions in Jokkmokk parish (approx. 67° N. 20° E., and some 19,744 km.2 in area.) determined natives' dependence on reindeer breeding, and have favored its The change from intensive success. (year-round) to extensive husbandry, introduced by Karesuando Lapps, is explained and related to border policies of Russia, Sweden, and Norway, 1852-1923. The ensuing change from the selfsubsistent Lapp household, the development of permanent camps and facilities along migration routes, regulations for pasturage, and variations in the patterns of reindeer migration are discussed. Individual camp sites in Jokkmokk are The most important factors described. in modern changes have been increased communications facilities and population The effects of penetrating numbers.

Swedish culture are considered, as are age and sex distribution of the Lapps, birth and death rates, and the probable future of the Lapp race and culture.

Animals exposed to sulphuric acid mist at 0° C. showed a better survival rate than similar animals at room temperature. This difference "is considered to

represent a direct action of the cold on the animals." Copy seen: DNLM.

47275. PATTON, W. J. H. Mississippian succession in South Nahanni River area, Northwest Territories. (American Association of Petroleum Geologists. Bulletin, Feb. 1956. v. 40, no. 2, p. 418-19.)

Contains abstract of paper presented at the Western Canada regional meeting of the Association, Jasper, Alberta, Sept. 14-17, 1955. A thick section of Mississippian rocks is exposed in the LaBiche Range of the Mackenzie Mts. near South Nahanni River (61°03' N. 123°22' W.). Rocks of Kinderhook, Osage, Meramec, and Chester ages are present. Fossil plants, Stigmaria sp. and Leipdodendron sp., and coal were found in sandstones below the Meramecian Spirifer cf. pellaensis zone. Microspores from the coal indicate a Lower Carboniferous or Mississippian flora. Copy seen: DGS.

47276. PATTON, WILLIAM WALLACE, 1923—, and R. S. BICKEL. Geologic map and structure sections along part of the lower Yukon River, Alaska. Washington, D. C. 1956. Map sheet 34 x 44½ in., incl. 2 maps, cross-sections. (U. S. Geological Survey. Miscellaneous geologic investigations, Map I-197.) Ref.

Results of stratigraphic and structural studies in July-Aug. 1954 in the southern Koyukuk Cretaceous basin. Map (scale 1:200,000), with explanatory notes, covers area from Ruby to Kaltag (approx. 64°30'-45' N. 155°-159° W.). The two sequences of Cretaceous sedimentary rocks have been subdivided, the border facies into two and interior facies into three mappable units, described in the notes. Structure sections show the folding and faulting that have greatly complicated the structure in the area. Sections also indicate types of fossils collected and show localities. Copy seen: DGS.

47277. PATTON, WILLIAM WALLACE, 1923—, and R. S. BICKEL. Geologic map and structure sections of the Shaktolik River area, Alaska. Washington, D. C., 1956. Map sheet 32 x 48 in., incl. 2 maps, cross-sections. (U. S. Geological Survey. Miscellaneous geologic investigations, Map I-226.) Ref.

Results of stratigraphic and structural studies in June 1954 in the southern Koyukuk Cretaceous basin. Map (scale 1:80,000), with explanatory notes, covers the area approx. 64°20′-47′ N. 159°30′-160°45′ W. in the Norton Sound region, including Ungalik River basin. Two sequences of Cretaceous sedimentary rocks were recognized, the border and interior facies, and each tentatively subdivided into two mappable units, described in the explanation. Structure sections show folds and faults of the region.

47281. PAULY, HANS. Bøggildite, a new phosphate-fluoride from Ivigtut, south Greenland. København, C. A. Reitzel, 1956. 15 p. 2 illus. (1 col.), tables. (Meddelelser om Grønland. bd. 137, nr. 6.) 6 refs. Also pub. as: Greenland. Geologiske undersøgelse. Bulletin, no. 14.

This new mineral was discovered by Bøgvad (Arctic Bibliography, No. 20773) in 1950 in the boundary rock of the cryolite mass in the quarry at Ivigtut (61°12′ N. 48°16′ W.). Author made further investigation on Bøgvad's specimens as no more of the mineral has been found. "It is monoclinic, X-ray examinations showing that it is pseudorhombic, belonging to space group No. 14 P 2 1/c. It appears in columnar aggregates up to 12 mm. long and some millimeters wide; it is salmon-colored. Bøggildite is colorless under the microscope;  $\alpha$ ,  $\beta$ ,  $\gamma$  are respectively 1.462, 1.466, and 1.469. 2 V lies between 78 and 80°. Axial dispersion can hardly be seen. The composition of the mineral corresponds to the formula Na2Sr2Al2(PO4)F9. It may be grouped together with the mineral known from Ivigtut, jarlite."-From Author's ab-Copy seen: DGS. stract.

47282. PAVLOVSKIĬ, NIKOLAĬ NIKO-LAEVICH. Sobranie sochineniĭ, t. 1. Moskva, Izd-vo Akademii nauk SSSR, 1955. 547 p. diagrs., graphs. Text in Russian. *Title tr.:* Collected works, v. 1.

Includes (p. 433-43) Neravnomernoe dvizhenie v estestvennykh vodotokakh (Non-uniform flow in natural water channels.) first pub. in 1936. Writer analyzes mathematically, the factors influencing the change in velocity of flow, with emphasis on effects of ice cover and

its roughness. A basic equation for uniform flow is presented with consideration of the resistance (roughness) of the channel walls and ice cover. This equation is modified for determination of modulus of channel resistance with above roughness factors and mean rate of turbulent flow. The general form of this equation is given as a function (o) of channel depths (z) and can be used for water flow with, also without, ice cover. Analysis of this equation is extended to cases of "transient condition" in which the rate of flow under ice cover either is increased by inflow of ground water and tributary streams, or reduced by a side outflow.

Materialy k osnovam ucheniâ o merzlykh zonakh zemnol kory, 1956. vyp. 3, p. 163-66, illus.) Text in Russian. Title tr.: Tangential stresses along lateral surfaces of foundations caused by ground thawing.

Experiments conducted to determine stresses developed on a foundation at thawing of frozen ground are described in detail. A pipe with water representing a foundation is placed in frozen ground and connected with the dynamometer. Frozen water is melted by an electric heater and increasing vertical forces are measured by the dynamometer. These forces would increase for soils thawing

under natural conditions where gradual thawing causes increased cohesion between the ground and foundation because some compaction of the upper ground layers occurs during the time required to thaw to deeper strata.

47287. PEARSON, HANK. How Raber & Kief drilled 900 holes in permafrost in the Arctic in midwinter. (Pacific builder and engineer, Nov. 1956. v. 62, no. 11, p. 58-59, illus.)

Contains description of drilling operation on a military construction job at Kotzebue, Alaska. The unit used to drill holes for piling was a Williams LDH-40 earth-boring machine powered by a 501-cu.in,-engine and provided with an Alaskaug 18- and 24-in. carbidetipped, hollow-point bit. The speed of 15 ft./min. used in permafrost was activated hydraulically. The machine was mounted on a wiggle-tail base equipped with facilities which permitted the operator to rotate the unit across the rear of the vehicle a distance of four ft. to either side of the longitudinal center line and to extend and retreat it horizontally over a distance of two ft. As many as 22 holes, 20 ft. deep and 24 in. wide, were drilled in 10 hr. The bit lasted through the drilling of 110 holes. Copy seen: DLC.

47288. PEDERSEN, ALWIN, 1899—. Begegnungen mit Moschusochsen. (Kosmos, Jan. 1956. 52 Jahrg. Heft 1, p. 16–20, illus., map.) Text in German. Title tr.: Encounters with musk oxen.

Contains information on the distribution of this animal during the (last) glacial period and at present (cf. map); its races and estimated numbers, behavior during encounter with humans, defense, social habits, life the year round, food, propagation, effects of climatic change, etc.

Copy seen: DLC.

47289. PEDERSEN, ALWIN, 1899—. Om moskusoksen og rensdyret på Grønland. (Naturens verden, København, 1953. årg. 37, hefte 7–8, p. 240–46). Refs. in text. Text in Danish. *Title tr.*: On the musk ox and reindeer in Greenland.

Takes issue with statements of Jennov q. v. The actual number of musk ox on Greenland is unknown; a count could be made most accurately late in the summer grazing season by aerial photography. Overgrazing of the vegetative area is questioned. Winter ice over the food supply, as in 1938-39, causes decrease in number but not decimation of the herds. Migrations of both musk oxen and reindeer are discussed. The musk ox habitat was probably not limited by the Eskimos of East Greenland as Jennov believes, nor the numbers greatly reduced until hunting became commercialized. Copy seen: DLC.

. .

47290. PEDERSEN, ALWIN, 1899—. Rosmarus, en beretning om hvalrossens liv og historie. København, Gyldendal, 1951. 98 p. illus., plates. Text in Danish. Title tr.: Rosmarine, an account of the walrus' life and history.

Walrus hunting and trade are described from early times to the present, based in part on the writer's hunting experience, largely on east and west coasts of northern Greenland. Commercial value of the tusks has been a factor, from the 13th century, in interest in the Arctic; and in the early 17th century nearly a thousand walrus were killed yearly for their tusks. The Atlantic form is found from Baffin Bay to the Kara Sea, and the Pacific form in the Bering Strait and north Siberian waters. Present population of each is estimated at slightly over a thousand. Protected areas are recommended in native habitats where warm waters enter the Arctic and keep the sea surface open all winter. Walrus life and its place in the arctic animal world are discussed, and extensively illus. with photographs. Copy seen: DLC.

9

47291. PEDERSEN, ALWIN, 1899—. Storie di trichechi. (Vie del mondo, Feb. 1956. anno. 18, no. 2, p. 205–212, 6 illus.) Text in Italian. *Title tr.:* Stories about walrus.

Walrus behavior, social life and food, movement on land and in the water is described; also a walrus hunt by Eskimos. Anecdotes of polar bears and walrus, walrus species, geographic distribution, etc., are given. Based on writer's experience in Greenland; a few good photographs are included. *Copy seen:* DLC.

47292. PEDERSEN, EINAR SVERRE. Handelsluftfahrt in der Arktis. (Polarforschung, 1954, pub. 1956. Bd. 3, Heft 1–2, Jahrg. 24, p. 301–304.) Text in German. Title tr.: Commercial flying in the Arctic.

Contains description of Scandinavian Airline System polar flights and typical problems connected with them.

Copy seen: DLC.

47293. PÉGUY, CHARLES PIERRE, and J. CORBEL. Chronique arctique. (Norois, July-Sept. 1956. Année 3, no. 11, p. 343-55) 47 refs. Text in French. Title tr.: Arctic chronicle.

A survey of recent events and activities in Alaska, Canada, Greenland, and Iceland, based on current publications. Deals briefly with plans for the International Geophysical Year; the tenth anniversary of the Arctic Institute of North America; Alaskan Science Conferences; Juneau Ice Field Research Project; Alaskan population and labor problems; meteorological stations in the Canadian

Arctic Islands; Ellesmere Ice Shelf Expeditions of 1953 and 1954; Canadian studies of sea ice and pingoes; relocation of Aklavik; the Aleut, Eskimo, and Indian populations, their present economic conditions, effects of contact with whites; glaciological research in Greenland by Expéditions polaires françaises; possible effect of transpolar air routes on Greenland, tourism. Copy seen: DLC.

47294. PEHRSON, ROBERT NIEL, 1926–1955. The Lappish herding leader; a structural analysis. (American anthropologist. Dec. 1954. v. 56, no. 6, pt. 1, p. 1076–80, table, graph.) 6 refs.

Discusses the problem of leader selection among the Könkämä Lapps of Karesuando parish, Sweden, and suggests the bilateral (father's and mother's line) descent tradition as one of its primary factors. Age, maturity and procreative ability, though not wealth, seem to be also of importance. Statistical data (1952) on population as well as number and size of summer and winter migratory groups are given. Copy seen: DLC.

47295. PEHRSON, ROBERT NIEL, 1926–1955. Reindeer herding among the Karesuando Lapps. (American-Scandinavian review, Dec. 1951. v. 39, no. 4, p. 271–79, illus.) 5 refs.

Popular account based on three anthropological field trips, Dec. 1948-Sept. 1949. The economic importance of the reindeer is stressed: it has enabled this group of Swedish Lapps to exploit their environment and maintain their culture as a functioning entity. Their migrations to summer and winter pastures cross a 180-mile stretch of country in Karesuando and Troms, Norway. individual and communal herding, use of dogs in herd management, reindeer branding, milking, castrating, slaughtering, etc. are discussed. Some Lappish techniques have been adopted by Finnish peasants. Copy seen: DLC.

47296. PĖK, A. V. K izucheniū tektoniki Khibinskogo massiva. (*In:* Fersman, A. E. Za poliārnym krugom, 1932. p. 18–22, illus.) Text in Russian. *Title tr.:* Investigation of the tectonics of the Khibiny massif.

A "tectonic party" of the Academy of Sciences' Kola Expedition, headed by F. fl. Levinson-Lessing and including the author, worked in the Kukisvumchorr and Yukspor mines and the vicinity, July 25-Sept. 25, 1932, studying intru-

sions, to determine the direction of tectonic forces. Without geological maps, no conclusive results were obtained (cf. No. 46333); the work is to be continued. **Copy seen:** SPRI; DLC (microfilm).

47297. PĖK, A. V. Nekotorye dannye po tektonike Khibinskogo raiona. (*In:* Khibinskie apatity, 1933. t. 6, p. 218–23, 4 diagrs.) Text in Russian. *Title tr.*:

Some data on the tectonics of the Khibiny

region.

Methods of study of dynamics of tectonic ore formation are discussed, based on collected observations, on mechanical deformation (fissures) in the intrusions of the Khibiny mountains. More or less definite regularities in distribution and concentrations of fissures are shown on four diagrams, corresponding to the tectonics of different mountains. sures are usually concentrated in two directions (NE. and NW.) at about a 90° angle. Knowledge of major crack distribution is essential for the structural characteristics and for rational mining of the deposit. Copy seen: DGS.

PENNELL, FRANCIS WHITTIER, 1886–1952, see Stair, L. D., and F. W. Pennell. A collection . . . plants . . . Yakutat . . . 1946. No. 48160.

47301. PENNER, EDWARD. Soil moisture movement during ice segregation. (National Research Council. Highway Research Board. Bulletin, 1956. no. 135, p. 109-118, illus., diagrs., graphs.) 10 refs.

Contains initial results of study of frost action processes by the Division of Building Research, National Research Council of Canada. Moisture flow to the freezing zone of small soil specimens (Leda clay, Whitehorse and Uranium City silts) was measured under controlled laboratory conditions. Where a free-water surface exists near but below the freezing zone, moisture flow is dependent on the unsaturated permeability and soil moisture tension characteristics. These properties integrate the effect of grain size structure, clay composition, and exchange ions. "Critical desaturation beneath the frost line in some soils appears to act as a barrier to liquid moisture transmission. Since in the heavier-textured soils, rapid moisture transmission continued to much higher tension values, greater heave rates are observed."-From author's abstract. Copy seen: DGS.

diagrs., tables.) ref.

Deicing of ships operating in arctic regions has long been a problem. Possible solution has been developed in the course of other work: Description is given of a portable shipboard deicer using a pair of phased valveless pulse jet engines 2.5 in. in diameter. The unit is easy-starting, lightweight, and capable of burning either diesel fuel oil or gasoline. The deicer has performed satisfactorily under tests over the temperature range from 95° F. to -32° F. A prototype unit is ready for arctic environmental tests.

Research and development are described leading to the full-scale testing of a space-link track (the Ground Hog) for travel over poor terrain. Tests in homogeneous soil showed a 55 percent gain in tractive effort over the closed-link track. Tests in Jan. 1954 at Kapuskasing, Ontario, in 26 in. of snow validated the It was recommended that superiority. a practical vehicle incorporating this principle be constructed in a half-toncargo capacity for travel over water, marshy terrain, muskeg, sand, snow, ice, Copy seen: DLC. or tundra.

PETERSON, MARTIN S., see USQM Food & Container Institute. Nutrition symposium. 1954. No. 48643.

47320. PETRI, BERNGARD ÉDUARD-OVICH, 1884— . Narodnoe iskusstvo v Sibiri; voprosy sobiraniâ i izucheniâ. Irkutsk, Irkutskoe otd-nie Sibgosizdata, 1923. 29 p. illus. 2 refs. Text in Russian. Titte tr.: Siberian native art; problems of collecting and study.

Explains advantages of public museums over private collections for preserving examples of native arts and crafts. Such objects, including those of Yakut, Ostyak, Koryak and Tungus origin, are disappearing, forced out of use by cheap industrial products. The importance of information on provenience and use of each item collected is stressed. Works of art most likely to remain static and conserve

native trends, e. g. religious pictures, ornaments, etc., are discussed and illus. Copy seen: DLC (microfilm).

47321. PETRI, BERNGARD ÉDUARD-OVICH, 1884- . Neoliticheskie nakhodki na beregu Balkala; predvaritel'noe soobshchenie o raskopkie stofanki "Ulan-Khada." (Akademifa nauk SSSR. Muzel antropologii i ėtnografii. Sbornik, 1916. t. 3, p. 113-32, illus., plates.) 6 refs. Text in Russian. Title tr.: Neolithic finds on the shore of Lake Baykal; a preliminary report on the excavation of the

"Ulan-Khada" site.

Reports author's summer 1913 excavations on the Ulan-Khada promontory near the Ol'khonskiye Vorota Strait (approx. 53° N. 107° E.). Eleven horizons of 20-30 cm. each, from depth 90 cm. down to about 4 m., were explored, but no dating attempted. The uninterrupted habitation of the site shows the evolution of neolithic artifacts from crude scrapers and flakes to polished nephrite hatchets; it should prove of help in the classification and eventual dating of Angara basin finds. The potsherds (none found on the lowest level) and the stone artifacts (arrow and spear heads, scrapers, borers, nuclei, saws, fishhooks, chisels, axes, sculptured fish, etc.) are described and illus. by drawings (20) and photographs (over 200). Copy seen: DLC.

47322. PETRI, BERNGARD ÉDUARD-OVICH, 1884- . Okhota i olenevodstvo u tuturskikh tungusov v svíazi s organnizatsiel okhotkhozfalstva. (Irkutsk. Universitet. Biologo-geograficheskil nauchno-issledovateľskiľ institut. vestifa, 1930. t. 5, vyp. 2, p. 3–103, illus., tables.) 6 refs. Text in Russian. *Title* tr: Hunting and reindeer-herding of the Tutura Tungus and the organization

of a hunting economy.

Reports the findings of the 1928/29 Tungusskafa ékspeditsifa sent to investigate the economic potentials of the Tutura district (approx. 54°-55° N. 106°-107° E.). The advantages of centralizing the Tungus population in this area, development of the squirrel trade, organization of reindeer- and cattle-herding kolkhozes, etc., are discussed. statistics (1851-1929) and statistical data (1928-29) on number of households, hunters, reindeer and cattle per camp are tabulated. The local fur and game animals are treated in turn, hunting or trapping methods described, and amount and value of the take in 1928/29 stated.

Local cults based on hunting, shamanism. reindeer herding, Tungus-Russian relations, etc., are dealt with.

o - ret - d

n

e lhoft.

h

d s

Reviews ice-breaker construction and growth of the Russian ice-breaker fleet from 1846 to 1950: the Ermak (10,000 hp.) built in England in 1898; two smaller vessels (1,200 hp.) the Valgach and Talmyr 1909, the former sunk in the Gulf of the Yenisey in 1918; during 1914-1918, 22 were built or purchased for convoy duty with transport vessels to and from Arkhangel'sk. Among these were the Sampo, Petr Velikit, TSar' Mikhail Fedorovich, Erl Gret (renamed the Litke), Litros' (Sadko) Il'ia Muromets, Koz'ma Knîaz' Pozharskii, Aleksandr Nevskit (Lenin) (all 3,000-7,000 hp.) and others. Six ice-breakers of 1,200-10,000 hp. were built for the port of Vladivostok: the Krasin, Mikula Selianinovich, etc. In the winter months of 1920-1925, 570 vessels made their way through the ice of the Gulf of Finland with aid of ice-Navigation to and from the breakers. Ob' and Yenisey estuaries was maintained by the ice-breakers Sedov, Malygin, Krasin, Cheliuskin, and Lenin for 46 transport vessels. The north Siberian route from the White Sea to Bering Strait opened in 1932 was serviced by the Sibiriakov with the general support of new polar stations along the route. Expeditions to the Ob', Yenisey, Lena, Kolyma, Yana, etc., were continued during the following years. Regular communication by passenger ships and oil tankers, with reinforced hulls (the Sever, Nenets, (Ukagir) was established in 1935 between Murmansk and Vladivostok with assistance of the ice-breaker-tugboats IAkutita, Levanevskit, Vodop'tanov, and The Stalin and Dezhnev com-Molotov. pleted in 1938 joined the northern icebreaker fleet. The large ice-breakers, Kaganovich and Mikoûan, were built at Nikolaev in 1939 and 1941. Three basic designs for arctic service are proposed for construction in 1946-1950, with various types of propulsion mechanism: turboelectric, diesel-electric and diesel or turbine with hydraulic transmission. The navigation season is considerably extended with a fleet of powerful new icebreakers, and danger of transport ships wintering in the ice is appreciably reduced. **Copy seen:** DLC.

47327. PETROV, M. Ledovye povrezhdeniâ sudov i bor'ba s nimi. (Morskol flot, Oct. 1950. god 10, no. 10, p. 34–37.) Text in Russian. *Title tr.:* Ice damage to ships and its prevention.

Various types of damage to a vessel going through ice fields are discussed with a view to avoiding them or reducing the Repair and reinforcing materials to be carried aboard ship are listed: lumber and hardware; cement, sand, calcined sodium carbonate (for low temperature concrete); patches with wire screens, pads, mats, etc. Propellers, rudders, bow stem and framing are considered the most sensitive to damage. Methods of repairing rupture or holes in hullplates, reduction of leaks, and simple reinforcement of the weak plates or bulkheads are briefly described.

Describes the leading part played by Russian bolsheviks in fomenting the 1905 and 1917 revolutions in Yakutia.

Copy seen: DLC.

47330. PETROV, V. I., and S. S. TSENIN. Razvitie ėkonomiki vostoch-

nykh raĭonov i ikh transportnoe osvoenie. (Zheleznodorozhnyĭ transport, Oct. 1956. god 38, no. 10, p. 42–48, map.) Text in Russian. *Title tr.:* The economic development of eastern regions and expansion of the transportation facilities.

The development of a third metallurgical and industrial region in Siberia, in addition to the Donetskiy and Kuznetskiy coal basins, is discussed with local details. Discovery and exploitation of natural resources (coal, ore, timber, minerals, rare metals, etc.) in the Ob', Yenisey, Lena, Angara River regions are related to problems of transportation. Development and improvement of waterways and motor highways, mainly north-south to the Kara and Laptev Seas, is required. Construction of new main, east-west, railroad lines is planned in coordination with the motor and water routes. Particular importance is given to construction of a second, and northern, trans-Siberian railroad in the near future. This line will connect Vorkuta with Ivdel' (60°42' N. 60°28' E.) and continue eastward along the 58° parallel to Ust'-Angara (Abalakovo 58°07' N. 92°43' E.), via Ust'-Kut to Bam (54°08' N. 123°42' E.) northeast to Chul'man (56°52' N. 124°52' E.) and Magadan on the Okhotsk The importance of this route for development of the northern regions is emphasized, because about 90 percent of the transportation is by railroad, seven percent by waterways, and three percent by motor transport. Consideration is given to construction of a pipe-line along the Siberian route for industrial centers of limited hydro-electric power.

47331. PETTERSEN, KARL JOHAN, 1826–1890. De geologiske bygningsforholde langs den nordlige side af Torne träsk. (Geologiska föreningen, Stockholm. Förhandlingar, 1887. bd. 9, häfte 6, no. 111, p. 420–33, map.) Text in Norwegian. Title tr.: Structural geologic relationships along the north side of Torneträsk.

The granite which extends northward from near Altavatn in Norway, north of Torneträsk, and appears at lower levels in Dividalen, outerops also along the eastern end of the north shore of Torneträsk in Sweden. From analysis of reported outerops near Torneträsk, Dividalen, and Balsfjord, it appears that in both Norway and Sweden the granite

and younger formations east of the border mountain chain are comparable.

1898—
And others. Meteorology of the Arctic. Washington, D. C., Mar. 1956. Xii, 207 p. illus., diagrs., tables, maps (U. S. Navy. Technical Assistant to Chief of Naval Operations for Polar Projects (Op-03A3) OPNAV PO3-3.) Other authors: W. C. Jacobs, and B. C. Haynes.

Contains a comprehensive review of the general meteorology and climatology of the Arctic. Meteorological parameters discussed include composition and structure of the atmosphere, inversions and lapse rates, acoustic and optical phenomena, air masses and fronts, cyclones and anticyclones, pressure, winds, temperature, precipitation, humidity, cloudiness and ceilings, fog and visibility, and illumination. Considerable climatic data covering most of these parameters are mapped and tabulated. Over 200 arctic and subarctic weather stations are listed together with their geographical coordi-

A study based on material collected during the 1949-52 Blue Dolphin Expeditions in the intertidal zone and on the continental shelf, between 51° and 60° N. lat. Sixty-eight species are described, 45 of them also reported from Point Barrow, Alaska. Information includes a list of stations and tables of distribution of the species as well as notes on their synonyms; morphology and anatomy,

occurrence and new records, geographic distribution, etc. Copy seen: DSI.

47338. PÉWÉ, TROY LEWIS, 1918— . Application of geology to engineering in Alaska. (*In*: Alaskan Science Conference . . . 1953. Proceedings, *pub*. 1956, p. 64.)

Construction of highways, airfields, bridges, large installations, etc., and farm development, involve problems of foundations and materials. Presence of permarfrost and intense seasonal frost action are factors in construction plans and site selection. Types of surveys are noted: survey of the geology (in detail) at a specific site; general engineering geology survey prior to site selection; the latter is part of program of Alaskan Geology Branch, U. S. Geological Survey.

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. Frost action annually causes vertical displacement of inadequately anchored piling on Alaska Railroad bridges in Goldstream valley. Factors favoring frost action are the long periods of intense cold and widespread silt deposits with high moisture content due to shallow permafrost (2–3 ft. below surface). To resist frost heave, piling should penetrate permafrost at least twice the thickness of the active layer. Copy seen: DGS.

47340. PÉWÉ, TROY LEWIS, 1918—. Permafrost investigations in the Fairbanks area, Alaska. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 169.)

Permafrost is absent on hilltops and south-facing slopes. In the Tanana River floodplain it is discontinuous but to 180 ft. thick in places; no large ice masses occur and ground water is available. North of the floodplain in alluvial silt fans, permafrost is continuous and about 175 ft. thick; large ice masses occur and ground water is absent. History of deposition, erosion, freezing and thawing during past 30,000 yrs. is outlined.

shezemel'skava Tundra.

In 1954, the Institute of Forests (Institut lesa) of the Academy of Sciences. together with the Pechora Railroad Administration, carried out an investigation of the natural conditions of tree growth between Usa and Vorkuta. The local vegetation is dwarf spruce, only 5 m. in height and 10-13 cm. diameter at over 100 years of age or more, dwarf arctic birch (Betula nana) deformed by damage from animals and man, shrubs, grasses and mosses of the forest-tundra. Soil temperature and chemistry data are tabulated and discussed in relation to the plant cover (cf. No. 41861). It was established that despite poor soil and severe climate, the forest is advancing into the tundra. Means of utilizing and furthering this process by soil amelioration and protection of trees are briefly. discussed. Copy seen: DLC.

General information on peat deposits is presented (p. 1-128), including their origin, vegetation cover, form and structure of the peat, degree of decomposition, geological structure and geographic distribution. Attention is given to the type and character of specific vegetation, its decomposition ability and relation to the stratigraphic classification of peat deposits. The hydrological nature of peat is described in relation to movement of ground water and geographic location. Second part of this work (p. 129-259) deals with various methods, instruments and procedures used in the surveying, sampling and recording of the deposits. Copy seen: DLC.

47349. PICKUP, J. D. Hypervitaminosis A. (Archives of disease in childhood, 1956. v. 31, no. 157, p. 229–32. illus.) 5 refs.

A description of two cases, in a boy of 6, and a girl of 4 years. Excessive medication with a vitamin A preparation was the cause of the disease in both cases; cessation of medication brought relief and cure.

47354. PIĬP, BORIS IVANOVICH. Izverzhenie Avachinskol sopki v 1945 g. (Akademifa nauk SSSR. Kamchatskafa vulkanologicheskafa stantsifa. Bfulleten', 1953, no. 17, p. 6-23, illus., tables.) 14 Text in Russian. Title tr.: The eruption of Avachinskaya Sopka in 1945.

Detailed description of a brief explosive eruption of this volcano on Feb. 25, and of the post-eruptive ejection of vapor and gas; based on author's observations Mar. 4-Apr. 16, and on prior (from Feb. 25) information from others. data on the physical properties and chemical composition of ejected volcanic sand are presented and discussed.

Copy seen: DLC.

47355. PITP, BORIS IVANOVICH. Klîuchevskafa sopka i ee izverzhenifa v 1944-1945 gg. i v proshlom. Moskva, Izd-vo Akademii nauk SSSR, 1956. 311 p. illus., tables, maps, plans (Akademisa nauk SSSR. Laboratorisa vulkanologii. Trudy, vyp. 11.) 196 refs. Text in Russian. *Title tr.:* Klyuchevskaya Sopka and its eruptions in 1944-

1945 and in the past. Monograph in three parts: the first (p. 11-77) deals with the Klyuchevskaya group of volcanoes generally, their physical-geography and geology with description (also illus.) and geological history of the 12 volcanoes which comprise it: Blizhnyaya and Dal'nyaya Ploskaya, Srednyaya, Klyuchevskaya, Kamen', Bezymyannaya, Ostryy and Ploskiy Tolbachik, Bol'shaya and Malaya Zimina, Bol'shaya and Malaya Udina. The group occupies area of ca. 8,500 sq. km; mean height of the volcanoes is 3,390 m., Klyuchevskaya Sopka (4,850 m.) being the highest. Former eruptions of Klyuchevskaya Sopka are treated in pt. 2 (p. 79-136), with a chronological summary of its activity from the eruption in 1697 noted by Vladimir Atlasov to that of 1937-38. The general characteristic of its eruptive activity is deduced from this chronicle (p. 132-36). Klyuchevskaya Sopka is the most active of the Kamchatka volcanoes, its periods of eruption followed by 1- to 9-year intervals of a quiet fumarolic state. The eruptions of 1944-1945 are reported in detail in pt. 3 (p. 137-303), based on author's observations from the Kamchatka Volcanological Station at Klyuchi, 32 km. distant, and during his trips to the lateral cones and his ascent of the summit soon after the eruption had subsided. Physical, mineralogical and chemical description of ejected lavas, bombs, lapilli, slags, ashes, sand and gases, also of the fumaroles, are given (p. 194-297). The decisive role of gases in the dynamics of eruption is stressed. Terminology is discussed in the introduction, and an extensive bibliography of Russian and foreign literature is appended.

"Inconsistencies in the definitions of slush, anchor ice, and ice jams in the manual for observers published in 1944 are noted, and processes of ice formation are described. The structure and size of ice crystals depend not only on temperature and duration, but also on the number of crystallization nuclei and the place of formation. Large ice crystals form from a small number of nuclei and vice versa. The following changes in terminology are recommended: the term anchor ice should be used only for ice crystals formed on the bottom of a body of water; underwater ice should apply to any ice formation observed within water, but not on its surface; ice jams should be defined as accumulations of underwater ice under an ice cover; ice blockings should refer to masses of broken ice that effectively decrease the width of the river bed."-SIPRE.

47364. PIOTROVICH, V. V. Vnutrivodnoe obrazovanie l'da. (Priroda, Sept. 1956. god. 45, no. 9, p. 94–95, illus.) Text in Russian. *Title tr.:* Formation of underwater ice.

English translation: Formation of depth-ice, by E. R. Hope for Canadian Defence Research Board, Directorate of Scientific Service, its Translation T 235 R, Ottawa, Nov. 1956 (4 p. illus.) Copy at CaMAI.

"Conditions of the formation and growth of anchor and underwater ice are briefly described, and effects of crystallization nuclei (AgI, PbI<sub>2</sub>, and ice crystals) on the freezing of supercooled water are discussed. The increased adhesion of water to solid substances (in

particular the bottom) upon supercooling causes the formation of anchor ice. Turbulent flow has a great supercooling effect by moving ice crystals down from the surface and by preventing ice-cover formation. Recent methods developed to control underwater ice at power plants utilize the instability of the supercooled state of water as well as the low adhesion values between ice and plastic coatings."—SIPRE

47365. PIRLET, KARL. Individualphysiologische Studien des Wärmehaushaltes. (Archiv für physikalische Therapie, 1956. Jahrg. 8, Heft 3, p. 162– 69, illus.) 10 refs. Text in German. Title tr.: Individual physiological studies

of heat economy.

A study of 15 persons, grouped according to body-build, reaction and vagotonal and sympathicotonal "stigmata". In cold environment only leptosome subjects showed shivering and increased energy metabolism, but their skin temperature was higher due to easier heat transfer from the core through the thin, lean skin. In contrast to the pycnosome type, the lean leptosome was unable to maintain a stable core temperature in the cold.

Būlleten', 1950, god 121, otdel geologicheskil, t. 25, vyp. 2, p. 44–74, 12 text maps.) 14 refs. Text in Russian. Title tr.: Structure of the Russian platform in the Devonian and Carboniferous periods.

Summary of geological investigations of basic tectonic elements of the European Russian platform (47°-69° N. 21°-60° E.). Analysis of phases, magnitude and structure are made of the Paleozoic de-

posits in the southeastern and northern parts of the platform. Modification of the earth's crust is studied with consideration of initial and definitely known phases of transgression. The analyses are illustrated by 12 geologic maps showing distribution of deposits at different periods during the Devonian and Carboniferous.

PITELKA, FRANK ALOIS, 1916—, see Hurd, P. D., and F. A. Pitelka. The role of insects . . . economy . . . birds. 1954. No. 45652.

47368. PLAFKER, GEORGE, 1929—. Geologic investigations of proposed Sheep Creek, Carlson Creek, and Turner Lake power sites, Alaska. Washington, D. C., 1956. 37 p. 3 illus., 4 maps (3 fold.), table. (U. S. Geological Survey. Reports, open file series, no. 394.) 10 refs.

Three sites (approx. 58°15' N. 134° W.) on the the mainland of Southeast Alaska near Juneau, streams draining into Gastineau Channel and Taku Inlet, were investigated during Aug.-Sept. 1954. Physiography, climate, and vegetation of the area are briefly described. Bedrock consists of northwest-trending metamorphic rocks dipping steeply to the northeast. Unconsolidated Quaternary deposits mantle much of the area. valleys of both creeks have been modified by Pleistocene glaciers, and Turner Lake occupies a rock basin formed by glacial scour. Information given for each site includes topography and surficial geology of reservoir site, bedrock geology of dam and powerhouse sites, conclusions and recommendations for construction. Conditions are favorable at all sites.

Copy seen: DGS.

47369. PLAFKER, GEORGE, 1929—. Occurrence of diatomaceous earth near Kenai, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 25–31, illus., 2 maps (1 fold.), tables. (U. S. Geological Survey. Bulletin 1039–B. Investigations of construction materials in Alaska.) 7 refs.

Diatomaceous earth is an unconsolidated earthy deposit formed by accumulation of the minute siliceous tests (skeletons) of diatoms. It occurs in postglacial lake deposits exposed along the shore of Cook Inlet north of the village of Kenai, Alaska. The largest and purest of these deposits, at approx. 60°41′ N. 151°23′ W., was mapped and sampled in detail in July-Aug. 1952.

47370. PLAFKER, GEORGE, 1929—, and D. J. MILLER. Reconnaissance geology of the Malaspina District, Alaska. Washington, D. C., 1956. 35 p. fold. map, table. Mimeographed. (U. S. Geological Survey. Reports, open file series, no. 379.) 26 refs.

Contains results of investigation of a 1675 sq. mi. area on the Gulf of Alaska coast between Icy Bay and Guyot Glacier on the west, and Yakutat and Disenchantment Bays on the east, extending inland 30 mi. to the St. Elias Mts. (approx. 59°45' - 60°20' N. and 139°30' -141°22' W.). Survey was part of a U. S. Geological Survey program to investigate petroleum possibilities of the Gulf of Alaska Tertiary Province. Bedded rocks are tentatively divided into four major sequences ranging in age from Cretaceous and older through unconsolidated Quaternary deposits. Each of these is described, the Tertiary sequence (third) in most detail. Three major orogenic periods are represented by unconformities separating the four rock sequences. The orogenies and resulting structure are described; also petroleum possibilities and coal resources.

47372. PLASS, GILBERT NORMAN, 1920- . Carbon dioxide and climate. (American scientist, July 1956. v. 44, no. 3, p. 302-316, graph.) 15 refs.

The carbon dioxide theory of climatic change is explained, with some discussion of relationship of mountain building and amount of CO2 in the atmosphere to major glacial epochs. Recent climatic amelioration may be result of extensive burning of fossil fuels in industry which adds more than 6 x 10° tons of CO2 per year to the atmosphere. If CO2 theory is correct, radiocarbon dates prior to the last glacier recession are questionable. If at the end of the century, average temperatures have continued to rise and measurements of atmospheric CO2 are also up, "then it will be firmly established that carbon dioxide is a determining factor in causing climatic change."

47375. PLUTCHIK, ROBERT, 1927—, and M. GREENBLATT. Temperature changes of the skin; a function of initial level. (American journal of psychology, Sept. 1956. v. 69, no. 3, p. 403–409, illus., tables.) 6 refs.

Account of investigation aimed to determine, how temperature changes of the skin (finger) depend on its initial temperature. Larger rises occur when initial temperature is low, but the amount of fall was unrelated to the initial level. The rate of change was always faster during increase than during fall of temperature. The lower (or the higher) the initial temperature was, the longer continued an increase (or decrease) of temperature.

(Annales de géophysique, 1956. t. 12, no. 2, p. 157-66, illus., diagrs., graphs, tables.) 4 refs. Text in French.

Title tr.: Scientific reports of the Expéditions polaires françaises N IV 1; air temperature in the first [few] meters above the Greenland inland ice.

Air temperatures between 0-3 m. were measured with thermocouples during the period Mar. 3-July 17, 1950 at the French Central Station (70°55' N. 40°38' W.). Various types of temperature variations as a function of height are diagrammed and discussed. Six major types are distinguished. A general tendency was found for an increase in temperature with height in these lower levels. The maximum effect was produced by the varying amounts of cloud cover. Extreme gradients were obtained under conditions of clear sky and no wind. Copy seen: DGS.

47382. POKROVSKIĬ, GEORGIĬ. Mankind's home, how to improve it. (News, a Soviet review of world events. Oct. 1, 1956. no. 19 (126), p. 19–21, diagr.)

Two suggestions are reviewed: one involves building a dam across Bering Strait to block the southward flow of arctic water, and with atomic power, to

pump warm Pacific water into the Arctic Basin (cf. No. 46628). The other for spraying snow and ice of the Arctic with a thin layer of some dark substance, say smoke-black, to accelerate melting. The hazard of raising the level of the world ocean is noted and the need for international cooperation to realize either of these suggestions is stressed.

47384. *POLAR RECORD*. [News notes.] (Polar record, 1956. v. 8, no. 52-54.)

Events and other news of arctic interest (except expeditions, obituaries, ships (infra) are summarized as follows:

Seventh meeting of the International Whaling Commission in Moscow, July 18-23, 1955, at which amendments to schedule of the 1946 Convention were recommended and proposals made on conservation of blue whales, inspection, observers on factory ships (no. 52, p. 44-45):

Sighting of large ice island from *Kista* Dan in Kong Oscars Fjord, East Greenland, Sept. 20, 1955, at approx. 72°05′

N. 23°W. (no. 52, p. 46);

Statement by W. A. Wood that ice island T-3 was first sighted Apr. 27, 1947, by crew of a U. S. Air Force B-29, in correction of former Polar record note (Arctic Bibliography, No. 41903) attributing discovery to Royal Canadian Air Force (no. 52, p. 66-67);

Topographic maps of Greenland issued by the Danish Geodaetisk Institut at scales 1:300,000, 1:250,000, 1:50,000, and

1:2,000 (no. 52, p. 39-42);

Topographic maps of Svalbard published by the Norsk Polarinstitutt at scales 1:2,000,000, 1:500,000, 1:100,000, 1:50,000, 1:25,000, and 1:10,000; the main series at 1:100,000 intended to cover Svalbard in about 50 sheets (no. 54, p. 273-76);

Confusion of names between U.S. Air Force base at old Thule settlement, North Greenland (76°34' N. 68°49' W.) and new Eskimo settlement to the north (77°27' N. 69°11' W.). Special Committee for the International Geophysical Year now designates the air base as Thule Air Base, and the Eskimo settlement as Thule Village (no. 53, p. 176-

Reasons for transfer of Aklavik, Mackenzie District, from West to East Channel of Mackenzie River, and factors by which suitability of potential sites was judged during relocation survey

(no. 53, p. 178-79);

Greenland bird-banding scheme, organized in 1946 by what is now Ministeriet for Grønland: 30,215 birds have been banded and 8.2 percent recovered, a remunerative occupation for Greenlanders, providing information for bird conservation (no. 54, p. 270);

Marking of 85 bison in Wood Buffalo Park by Canadian Wildlife Service using helicopter and spraying animals with paint from hand fire-pump (no. 52, p.

44);

Transport of 300 reindeer from Fin-North Norway, to Godthaab mark, region, West Greenland, in Sept. 1952; in May 1955 herd numbered 459 (no. 54, p. 272-73);

New method of determining age of the larger whales depending on occurrence of laminations in the wax plug in the "ear"

(no. 53, p. 175);

McGill University Sub-Arctic Research Laboratory at Knob Lake, Quebec, built in 1954; its field program (no. 54, p. 277);

Map showing name, location, and function of 107 Soviet polar stations under jurisdiction of Chief Administration of the Northern Sea Route (Glavseymorput'); discrepancies noted between this map and one produced 1956 by Glavsevmorput' showing proposed Soviet IGY stations (no. 54, p. 278-79);

Place of the Soviet Arctic in the U. S. S. R. sixth five-year plan, 1956-60

(no. 53, p. 177); Notes on "strand cracks," "ice Notes on "strand cracks," "ice streams," and definition of "ice rise," supplementing Arctic Bibliography, No.

37692 and 42100 on ice terminology (no. 52, p. 64-66);

Five-man Cambridge Expedition to East Greenland led by J. H. Latter, July-Aug. 1955, to band pink-footed and barnacle geese, Anser brachyrhynchus and Branta leucopsis (no. 53, p. 155);

Studies of vegetation, bird distribution, mammals and insects, and plant pollination by five-man Cambridge Expedition to Lapland, June-July 1955, in area 68°27′ N. 20°47′ E., northern Sweden

(no. 53, p. 155);

Fourteen-member Cambridge Spitsbergen Physiological Expedition, summer 1955, led by M. C. Lobban, continued work started in 1953, with bases in Billefjorden region, Vestspitsbergen (no. 54, p. 253-54);

Durham University Expedition to Svartisen, North Norway, June-Sept. 1955, an eight-man party led by W. S. Moffat carried out survey, geologic, glaciological, botanical and zoological work and a bathymetric survey of Svartisenvatn (no. 54, p. 254);

Nottingham University Expedition to northern Vestspitsbergen, summer 1955, a six-man party led by M. Mellor did glaciological and geologic work in the Kongsfjorden region and icecap to the

east (no. 53, p. 155-56);

Oxford University Expedition to Nordaustlandet, July-Sept. 1955, the eightman party led by J. T. Hollin continued glaciological work begun by Oxford and Cambridge Spitsbergen Expedition of 1951; also geologic, botanical investigations and gravity measurements (no. 52, p. 26);

Flights by two Royal Air Force Hastings aircraft from Resolute, Cornwallis Island, to North Pole and return, May 1955; transpolar flight by Canberra bomber Aries IV from Bardufoss, Norway, to Fairbanks, Alaska, June 1955

(no. 52, p. 26–27);

Norsk Polarinstitutt expedition in the *Minna* to Vestspitsbergen July 2-Sept. 2, 1955, for geological mapping and soundings and inspection of radio beacons and lights; also annual relief expedition to northeast Greenland, July 23-Aug. 29 (no. 53, p. 154);

Investigation of Lapp sacrificial sites, dialect, folk traditions, reindeer husbandry, and customs by Landsmålsarkivet i Uppsala, 1950–1953, in northern

Sweden (no. 52, p. 24);

Swedish Expedition to Svalbard, summer 1954, in which a four-man Uppsala University group carried out geomorphological and biological investigations in the Tempelfjorden region, Vestspitsbergen (no. 53, p. 152);

Austrian Expedition to Spitsbergen, July-Aug. 1954, consisted of a seven-man mountaineering party led by H. Gsellmann; some 30 peaks in the Krossfjorden-Kongsfjorden region of Vestspitsbergen were climbed for the first time (no. 52,

p. 25);

Establishment of Soviet drifting stations North Pole-3 and -4 on the ice in Apr. 1954, drift of the stations, evacuation of -3 and relief of -4 in Apr. 1955, and establishment of North Pole-5 at 82°04′ N. 157° E. (no. 52, p. 27-28, map);

Oceanographic expedition of Soviet ice-breaker Fedor Litke north of Zemlya Frantsa-Iosifa to 83° 11'N. 49°03' E.,

Sept. 1955 (no. 52, p. 27).

Copy seen: DLC.

47386. *POLAR RECORD*. [Notes on ships]. (Polar record, 1956. v. 8, no. 52-54.)

Construction and other news of the following ships is reported:

British fisheries research vessel Ex-

plorer, built for the Scottish Home Dept., launched June 1955, with hull strengthened for work in ice (no. 53, p. 180); research ship Shackleton, originally built in Sweden in 1954 for ice work on Norwegian coast, purchased by Falkland Islands Dependencies Survey in Aug. 1955 (no. 53, p. 180-81);

Willem Barendsz, Dutch whale factory ship, launched Nov. 1952, largest of its kind: 44,000 tons displacement, can also be used as a tanker (no. 52, p. 46);

Glacier, U. S. Navy ice-breaker launched Aug. 1955, 8,300 tons displacement, largest and most powerful American-built ice-breaker (no. 53, p. 181);

Loss of Norwegian ship Jopeter, beset in ice off East Greenland in early Sept.

1955 (no. 53, p. 179-80);

A proposed classification of ships for use in ice consists of two main categories: ice-breakers, and ice-strengthened ships, with subdivisions of each (no. 52,

p. 45-46);

Table of statistics on recent ice-breaker construction: nationality, completion data, displacement, dimensions, engines, speed, horsepower, and builder are given for: Elbjørn (Denmark), Thule (Sweden), d'Iberville and Labrador (Canada), Voima (Finland), Kapitan Belousov and another unnamed (U. S. S. R.), and Glacier (U. S.); four more are noted to be under construction (no. 52, p. 47).

Copy seen: DLC.

**47387. POLAR RECORD.** [Obituaries]. (Polar record, 1956. v. 8, no. 52–54.)

Brief obituaries are given for Prof. Haakon Shetelig, 1877–1955, authority on Scandinavian pre-history and Viking

archeology (no. 52, p. 68);

Monseigneur Arsène Turquetil, 1876–1955, Prefect Apostolic of Hudson Bay from 1925, who went to Canada in 1900 and established missions at Chesterfield Inlet, Eskimo Pt., and Southampton Island (no. 52, p. 68);

Dr. Robert Charles Wallace, 1881-1955, Executive Director of the Arctic Institute of North America (no. 52, p. 68).

Copy seen: DLC.

47388. THE POLAR TIMES. No. 42–43, June–Dec. 1956. New York, American Polar Society, 1956. 2 nos.: 36 p. 32 p. illus., text maps. Photolithographed.

Scope and type of information is similar to that of previous issues (Arctic Bibliography, No. 13630, 41907). Of par-

ticular interest are items on IGY., 1957-1958; DEW Line in northern Canada and Alaska; new Aklavik site; Eskimo scouts with the Alaska National Guard; rising birthrate among Eskimos eating "white men's food"; arctic tour of the Governor General of Canada; new polar stamps; new radio relay communications network ("White Alice") in Alaska; 1956 U. S. supply mission to DEW Line sites and other bases; Canadian Eastern Arctic Patrol, 1956; J. L. Giddings' discovery of 3,000-4,000 yrs. old "house" at Eschscholtz Bay, Kotzebue Sound, northern Alaska; obituaries of polar explorers, scientists. Copy seen: DGS.

47389. POLARBOKEN. Fra Arktisk Forening. Tromsø. (Polarboken, 1956, p. 191–92.) Text in Norwegian. Title tr.: From the Arctic Association, Tromsø.

The Association's activities are reviewed as reported at its sixth annual meeting Mar. 21, 1956: assistance to fishing and hunting interests, resupply of Bjørnøya and Svalbard, educational meetings with north Norway's home defense, publication of a small book about the Association, and collection of old skippers and hunters' memoirs, etc. Officers and board members are listed; membership is approx. 600.

47390. POLÍAKOV, A. S. Razvitie i razmeschchenie proizvoditel'nykh rajonov evropeľskogo Severa v shestoľ píatiletke i zadachi ekonomicheskol geografii. (Akademisa nauk SSSR. Izvestifa, serifa 1956. no. geograficheskafa. Nov.-Dec. 6, p. 70–76.) Text in Russian. tr.: Development and distribution of the productive forces of the European North in the sixth five-year period and the objectives in economic geography.

Coal in Vorkuta and Inta, oil at Ukhta, the wood industry of Arkhangel'sk Province, and new railroads, including the Pechora railroad, have been developed during previous five-year periods. For the sixth, further achievement is planned in all these fields, beginning with the wood industry, railroads and waterways. A new metallurgical and machinery manufacturing center, based on Kola Peninsula iron and Pechora basin coal, is to rise in the Cherepovets area. Its importance is discussed, and economic, geographic and geological investigations, ancillary to industrial development, are outlined. Development

of the large peat deposits and of waterpower in the North is essential.

47391. POLKANOV, A. A. Kratkii ocherk dochetvertichnol geologii naibolee vostochnol chasti Fennoskandii: Karelii i Kol'skogo Poluostrova. (Leningrad. Universitet. Uchenye zapiski, 1940, serifa geologo-pochvennykh nauk, no. 49, vyp. 9, p. 5–20, maps.) Text in Russian. Title tr.: Brief review of pre-Quaternary geology of the eastern part of Fennoscandia: Karelia and the Kola Peninsula.

Petrographic and geologic studies of many investigators have established that not only Archean and Proterozoic formations are developed on the Kola Peninsula and Karelia, but also formations of the Paleozoic era (cf. map, p. The more recent geological periods for Fennoscandia, Kola and Karelia are Similarity of the Paleozoic discussed. geological history and structure in these regions is analyzed with consideration of geometric symmetry and geology of both Scandinavian and Russian areas. Archean, Cambrian and Silurian formations are reviewed in detail. Copy seen: DLC.

47392. POLONSKIĬ, N. V., and K. V. ALEKSEEV. Geografo-gidrologicheskie issledovanifâ basselna r. Umby. (In: Khibinskie apatity, 1933. t. 6, p. 241–43.) Text in Russian. Title tr.: Geographic and hydrological investigations of the Umba River basin.

The Umba basin (24 km. in length, in southwest Kola Peninsula approx. 67°15' N. 34° E.), is studied in three sections in relation to hydro-electric installations: the upper part from the Kapustin lakes region is characterized by marshy lowlands with sandy moraine islands and streams with high banks of gabbroamphibolites, augite porphyry and micaquartz, ending in a 17 m. waterfall. middle part from Lower Kapustin Lake to the Poncheozero has banks mainly of biotite gneiss and a number of large The lower part of the Umba basin extends through the area subjected to erosion from the White Sea. 12 millions cu. m. of diatomite deposits are located in the region of the Umba River. The total fall of the river is 151

m., which can be used in nine stages (43, 25, 20, 17, 12 and a few 10 m. drops). Copy seen: DGS.

47393. POLONSKIĬ, N. V. K izucheniû diatomitov. (In Fersman, A. E. Za polûrnym krugom, 1932. p. 65–68, illus.) Text in Russian. Title tr.: The study of diatomites.

Diatomites, needed in the building industry, were searched for on Kola The first sediments were Peninsula. found on the bank of the Sergevan' River, 8 km. south of the town of Lovozero (68° N. 35° E.). In 1931 the Lovozero team of the Academy of Sciences' Kola Expedition, headed by the author, discovered and investigated nearly 20 deposits of diatomites located 12-40 km. from the railroad, amounting altogether up to 30 million cu. m.; in 1932, the same team worked in the southern part of the peninsula and found five deposits with approx. 10 million cu. m. of diatomites; while another team, headed by S. F. Egorov, found valuable deposits in the Lake Imandra region and along the Murmansk railroad.

Report of an investigation on the viability of human epithelial and spindle cells frozen within less than a minute to temperatures of  $-1.4^{\circ}$  C. to  $-35.7^{\circ}$  C. and subsequently rapidly thawed. Spindle cells survived exposure to  $-29.2^{\circ}$  C., preputial epithelium  $-24.4^{\circ}$  C, epidermis and scar tissue  $-20.5^{\circ}$  C. Copy seen: DNLM.

47399. POMERAT, CHARLES MARC, 1905—, and others. Thermal stress and tissue culture, 4; the intensity-time factor. (Texas reports on biology and medicine, 1954. v. 12, no. 2, p. 345-53, illus., tables.) 2 refs. Other authors: J. Nakai and P. F. Gilliland.

Account of experiments with skin and muscle cultures from chick embryos, exposed to deep freeze (-14.5° to -16.0° C.) and to ice-box temperatures (+2.0° C. to +7.0° C.). The time of exposure required to produce total inhibition of cellular emigration was used as criterion. The results indicate that cellular injury increases with increased storage time as well as with increased cold intensity.

Copy seen: DNLM.

47400. POMERAT, CHARLES MARC, 1905—, and others. Thermal stress and tissue culture, 5; efforts to enhance outgrowth following cold injury with the use of Rimifon, Marsilid and various cortisone preparations. (Texas reports on biology and medicine, 1954. v. 12, no. 2, p. 354-69, illus., tables.) 21 refs. Others authors: J. Nakai and T. G. Blocker, Jr.

Account of experiments with embryonic chick cultures and cultures of human rib marrow. The first two preparations failed to produce better outgrowth from cold injured explants. Some evidence was found for the beneficial action of cortisone, especially hydrocortisone at  $2\gamma$  per ml. of nutrient medium. Pt. 6 of this study deals with heat effect.

Copy seen: DNLM.

47401. POMERAT, CHARLES MARC, 1905-, and P. S. MOORHEAD. Thermal stress and tissue culture, 7; the effect of glycerol on cells with special reference to protection against freezing. (Texas reports on biology and medicine, 1956. v. 14, no. 1, p. 237-53, illus., tables.) 11 refs.

Contains a study on the effects of various methods of freezing upon tissue fragments from chick, mouse and rat. The effects of glycerol on freezing and thawing, on cell organoids and on cell activity were investigated. Results varied depending on issue, speed and depth of freezing; presence or absence of glycerol, Copy seen: DNLM.

"Investigations earried out since 1823 on the distribution and structure of fossil ice are outlined, and hypotheses concerning the phenomenon are discussed. These data, corroborated by special investigations carried out in N. Siberia since 1949, indicate the correctness of the Bunge hypothesis (1887) which associates fossil ice with water freezing in frost fissures. The polygonal structure of fossil ice and its distribution in alluvial river valleys under muddy peat disprove the popular hypothesis of the origin of fossil ice from firn."—SIPRE. Copy seen: DLC.

47412. POPOV, A. I. Le thermokarst. (Łódzkie towarzystwo naukowe. Biuletyn peryglacjalny, 1956. nr. 4, p. 319–30, 4 illus., diagr.) 9 refs. Text in French. Title tr.: Thermokarst.

Thermokarst is the result of soil subsidence due to thawing of frozen rock or fossil ice masses. Relief forms depend on the form and quantity of the ice. Shallow thermokarstic forms are found in more southerly regions where the layers and veins of ice diminish with depth; the very large and deep forms exist in the North where the ice extends to great depths. Amelioration of climate is not indispensable for thermokarst formation which can occur in a climate becoming colder and at the same time more continental in type.

nifa

Gives the tribal names, distribution, population statistics (1445 in 1926) and history of this predominant ethnic group on the Taymyr Peninsula. Their material culture is discussed: nomadism, reindeer herding, hunting (use of camouflage shields on runners, poisoned arrows and bullets are noted), fishing (drag-nets), food, various types of tents (chum), clothing, etc. The tribal structure (patriarchate with traces of original matriarchate), communal economy, and religious beliefs are sketched. The post-Revolutionary period progress, is described: collectivization was completed by 1938; native economies are expanding; a gradual settling of nomad groups is still in progress; advances in education, housing, changes in customs, etc., are Copy seen: DLC. noted.

47414. POPOV, ANDREĬ ALEKSAN-DROVICH. Kety. (*In:* Akademiâ nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956, p. 687–700, illus.) 17 refs. Text in Russian. *Title tr.:* The Kets.

Relates the historic and present distribution of the Kets, or Yeniseians, now (roughly) along the Turukhan and middle Yenisey Rivers. Their language, unrelated to any living language, was spoken by 1225 people (1926 census); their assimilation with neighboring tribes and Russians, and their history generally are sketched. Their hunting (squirrels and large game), fishing and reindeer herding are described. They used reindeer-drawn sledges, dugouts, nomadic tents (chum), mud-houses; on the Podkammenava Tunguska: dog-drawn sledges, houseboats. Their tribal division into phratries and clans, inheritance practices, shamanism, burial customs, etc., are discussed. With the Soviet regime, kolkhozes have been introduced, the reindeer-herding and other economic Trade, education, activities expanded. etc., are sketched. Cooperation of B. O. Dolgikh is acknowledged in preparation of this article. Copy seen: DLC.

47415. POPOV, ANDREÏ ALEKSAN-DROVICH. Nauchnyl trud o narodakh Severa. (Dal'nil Vostok, Nov.—Dec. 1956. god 24, no. 6, p. 167–71.) Text in Russian. Title tr.: Scientific work on peoples of the North.

Review of M. A. Sergeev's work Nekapitalisticheskiš put' razvitiū malykh narodov Severa (No. 42402). Summary of the contents is given with favorable comment and note of some minor shortcomings. Copy seen: DLC.

47416. POPOV, ANDREĬ ALEKSAN-DROVICH. Nganasany. (In: Akademifa nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 648–60, illus.) 9 refs. Text in Russian. Title tr.: The Nganasans.

The most northern of all the peoples of U. S. S. R., this Tawgi-Samoyed group (867 in 1926) inhabits the Taymyr Their linguistic and racial Peninsula. affiliation, history, and pre-Revolutionary economy are reviewed. Reindeer herding was poorly developed, reindeer hunting (described) and fishing were the main means of subsistence. Man- and reindeerdrawn sledges, food (preservation, storage, etc.) clothing, tribal subdivisions, property rights, marriage, religious beliefs, folk-lore, etc., are described. collectivization and resulting changes in their customs and economy are discussed: the increased reindeer herding, enforcement of hunting and fishing regulations, etc. Copy seen: DLC.

47417. POPOV, ANDREĪ ALEKSAN-DROVICH. Pletenie i tkachestvo u narodov Sibiri v xix i pervoī chasti xx stoletiā. (Akademiā nauk SSSR. Muzeī antropologii i ėtnografii. Sbornik, 1955. t. 16, p. 41–146, illus.) Approx. 50 refs. Text in Russian. *Title tr.:* Weaving and spinning by the peoples of Siberia in the 19th and the first part of the 20th century.

Discusses the native crafts of braiding, weaving, and spinning, in their historical development, areal diffusion and local techniques among the peoples of Siberia including the Yakuts, Lamuts, Voguls, Golds, Yukaghirs, Dolgans, Tungus, Chukchis, Koryaks, etc. The implements, methods, and the raw materials (reindeer and seal skin and sinew, fish bladder, animal hair, grass fiber, tree bark, etc.) used for the making of rope and thread are described and illustrated. finished products: nets, mats, baskets, belts, tape, etc. are similarly presented. Many photographs and more than a hundred drawings elucidate the text.

47418. POPOV, T. N Nakhodki iskopaemykh zhivotnykh v vechnol merzlote. (Priroda, Sept. 1956. god 45, no. 9, p. 40–48, 5 illus., text map.) 8 refs. Text in Russian. Title tr.: Finds of fossil animals in permafrost ground.

Review, based mainly on No. 17836, of fossil mammoth and rhinoceros investigations in northern Siberia. The first mammoth, found in the Lena delta (72° N.) in 1799, was investigated by M. F. Adams in 1806, skeleton recovered and placed in the Zoological Museum of the Academy of Sciences. Between 1805 and 1900, some 30 mammoth finds were In 1901 the well-preserved remains of a frozen mammoth (Elephas beresovkius) in situ were excavated by the expedition of O. Herz (cf. No. 7035-7036) in the Berezovka River region of Siberia. K. A. Vollosovich excavated mammoth parts found by A. Gorokhov in 1906 on Bol'shoy Lyakhovskiy in the New Siberian Islands. A mammoth skeleton was brought from the Taymyr Peninsula in 1949 by the Expedition of the Academy of Sciences U. S. S. R. In all, 34 mammoth carcasses and five of rhinoceros have been found in the frozen ground of Siberia. Copy seen: DLC.

A study based on field work conducted during 1950, 1951, 1953 and 1954; it deals with types of forests surveyed, food of hares as determined by stomach contents, and its month-by-month frequency. Detailed analysis is given of summer feed, its general nutritive value; details of winter food are included. Chemical composition of common trees used as food, and of summer and winter grass, proportions of various feeds taken at different seasons and in different regions are treated in turn, with discussion of food conditions and their effect on the hare population. 47420. POPOV, V. Bogatstva Sibiri, na sluzhbu Rodine. (Sibirskie ogni, Mar.—Apr. 1956. god 35, no. 2, p. 133—42.) Text in Russian. *Title tr.:* The riches of Siberia in the service of the fatherland.

Outlines industrial potentials of Siberia and stresses advantages and importance of their development. Iron ore deposits discovered in 1946 near the Angara-Yenisey junction and those recently found near the coal basin of southern Yakutia are noted. The hydro-electric stations, operating and planned, on the Ob', Yenisey, Angara and Lena Rivers and lumber production of Krasnoyarskiy Kray are discussed. Copy seen: DLC.

47421. POPOVA, A. I. Sporovo-pyl'tsevye spektry chetvertichnykh otlozheniĭ tsentral'nol Ākutii v svíāzi s istorieľ razvitiía rastitel'nosti ee v posletretichnoe vremā. (Akademiā nauk SSSR. Ākutskiĭ filial. Yakutsk. Institut biologii, Trudy, 1955. vyp. 1, p. 136–46, illus., tables.) 8 refs. Text in Russian. Title tr.: Spore and pollen profiles of Quaternary deposits in central Yakutia in connection with the history of development of its flora during post-Tertiary times.

About a hundred samples of early alluvial deposits were collected at eight different points of central Yakutia. An attempt is made to reconstruct the course of development of the Quaternary flora of the area on the basis of spore-pollen analysis and to aline it with the geomorphic peculiarities of the area. Climatic conditions are also reconstructed.

**47430. POST, LOUIS A.** The role of the Gulf Stream in the prediction of iceberg distribution in the North Atlantic. (Tellus, Feb. 1956. v. 8, no. 1, p. 102–111, diagrs., tables, maps.) 11 refs.

Contains correlations among the annual frequency fluctuations of the icebergs and the preseasonal sea surface current and temperature in the Florida Straits, as well as those of the Labrador Current three years later on the basis of 26 years' data. Fluctuations in the Gulf Stream are suggested as the single major factor controlling iceberg distribution in the North Atlantic south of 48° N. lat. The relatively good agreement between these variables is attributed to the current strength of the Gulf Stream which has an immediate effect on southward drift of bergs and an additional effect delayed by three years on the Labrador Current. An iceberg-prediction table is included utilizing mean sea temperatures at Key West for March of the same year and three years earlier. Copy seen: DLC.

POTAPOV, LEONID PAVLO-47433. VICH. 1905- . Istoriko-ėtnograficheskii ocherk russkogo naseleniia Sibiri v dorevolutsionnyl period. (In: Akademisa nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956, p. 115-214, illus, incl. col. plates.) Approx. 90 refs. Text in Russian. Title tr: Historicalethnographic outline of the Russian population of Siberia in the pre-Revolutionary period.

Reviews the Russian advances into Siberia from the 12th century on: exploration of the main rivers (Ob', Yenisey, Lena, Angara) and their estuaries in the 17th century, gradual absorption of the Far East and occupation of the Aleutian Islands and Alaska in the 18th century. The fur trade, early exploitation of natural resources and subsequent development of local industries are described. Introduction of agriculture and animal husbandry, resettlement of Russian peasants, founding of towns and trading posts, building of railroads, schools and hospitals, etc., are discussed, stressing the peaceful assimilation of the territory and the beneficial aspects of Russian colonization. The adaptation of Russian peasants to local (including northern) conditions, hunting and fishing along the Arctic and Pacific Oceans (gear, methods, main food fishes and fur animals, etc.), use of draught dogs and reindeer, transportation (river boats, sledges, etc.), housing, clothing, creative arts, etc., are described. Selected statistics (17th-19th centuries) on Russian population and industrial production are mentioned. The collaboration of S. V. Ivanov, G. S. Maslova and V. K. Sokolova is acknowledged.

47436. POTZGER, JOHN ERNEST, 1886–1955, and A. COURTEMANCHE. A series of bogs across Quebec from the St. Lawrence valley to James Bay. (Canadian journal of botany, July 1956. v. 34, no. 4, p. 473–500, 3 illus., 19 diagr., table.) 18 refs. Pub. also as: Publication 281 of the Botanical Laboratory of Butler University and Contrib. 15 of the Service de Biogéographie, Université de Montréal.

Contains results of the boring of 19 bogs, 45°07′ – 51°59′ N., at about 50-mile intervals, including a few in the Nottaway-Rupert-Eastmain River area. Up to 47° N., five major climatic changes are recognized and designated Q¹-Q⁵. "The single most striking feature of the study is that red-white pine penetrated

as important forest associates to the Rupert River (51°28' N.) . . . during the prominent warm-dry period (Q3) The great change in vegetation type, with more emphasis on boreal species (Picea mariana and Pinus banksiana) . . . suggests the Cochrane oscillation influence and subsequent retreat during the ensuing major xerothermic period (Q3). This period had probably waned by the time the forests were able to invade the James Bay region, thus giving rise to a rather monotonous changeless forest history from lat. 50°54' northward (Q5)." Pollen count of shrubs and herbs is tabulated in relation to that of trees, and bog profiles are given.

47437. POULSEN, ARTHUR O. The occurrence of manganese ores in Norway. (In: International Geological Congress. 20th, Mexico City, 1956. Symposium sobre yacimientos de manganeso. Tomo 5, Europa, p. 291–98, 2 text maps, tables.) 6 refs.

Manganese ore deposits of sedimentary origin are found in the Ofoten region (68°27' N. 17° E.), where manganiferous strata, interbedded in limestones and mica schist, form a large syncline with arms extending north-northeastward. Ore minerals are pyrolusite, magnetite, and hematite. Manganese and iron content varies. In deposit on Hinnøy in the Vesterålen Islands (68°30'-69° N. 15° E.), ore is quartz-banded manganiferous hematite, with sections as high as 35 percent iron, 8 percent manganese. Similar ore is found at Hamarøy on the mainland to the south. Deposit of manganosiderite has been found on Rubben Mt. northeast of Narvik (approx. 69° N. 19° E.), averaging 30-40 percent iron and 7-81/2 percent manganese. No deposits are being developed at present. Copy seen: DGS.

47438. POULSEN, CHRISTIAN. 1896- . The Cambrian of the East (In: Inter-Greenland geosyncline. national Geological Congress. 20th, Mexico City, 1956. El sistema Cámbrico, su paleogeografía y el problema de su Tomo 1, p. 59-69, base: symposium. 2 text maps, tables.) 12 refs.

The "Eo-Cambrian," a series of strata below the fossiliferous Lower Cambrian in Norway, contains deposits of glacial origin. Similar Eo-Cambrian deposits are found in northern Sweden, Svalbard, East and North Greenland, Siberia, China, and Australia. Age of strata (late Precambrian or early Cambrian) has been debated. The East Greenland Eo-Cambrian is here regarded as Lower Cambrian. Lower, Middle, and Upper Cambrian of the fjord zone (72°-74°30′ N.) and the nunatak zone to the west are discussed, also fauna and correlations.

47441. PRAGER, HANS GEORG, 1925— Orkan in Höhe Bäreninsel; sieben Wochen Eismeerfahrt. Stuttgart, Franckh, 1953. 167 p. illus., maps. Text in German. Title tr.: Hurricane in latitude Bjørnøya; seven weeks' voyage in the arctic sea. An English translation was pub. as: Through arctic hurricanes; adventures of a fishery protection ship, New York, T. Yoseloff, 1956 (copy in DLC).

Account of a trip of the fisheries-auxiliary Meerkatze from Cuxhafen along the Norwegian coast to the fishing grounds located between Bjørnøya (72°26' N. 19°5' E.) and the mainland. In addition to the description of the trip and life aboard ship, the book contains information on the structure and equipment of the Meerkatze, its function; on fishing boats and equipment, especially recent developments in the latter; physical and biological oceanography; fisheries biology; fishing methods; etc.

47442. PRAT, HENRI. Régimes de la thermogenèse chez la blatte américaine: Periplaneta americana (L); effets d'excitations olfactives; influence de la décapitation. (Revue canadienne de biologie, Feb. 1956. v. 14, no. 4, p. 360–98, illus.) 10 refs. Text in French. Summary in English. Title tr.: Thermogenetic regimens of the American cockroach, Periplaneta americana (L.); effects of olfactory excitations; influence of decapitation.

At a temperature of 31° C., the thermogram of these insects represents a straight or thinly undulated line. From time to time a 2-6 times higher heat flux, lasting 10-15 minutes is observed. Frequency of these heat paroxysms depends on environmental factors as temperature, humidity, air composition, etc. Mechanical, olfactory, visual or sexual stimuli also evoke paroxysms. The effects of removal of the antennae or of the head as well as conditions in the severed head, thorax, abdomen, and in headless insects, were also studied. Copy seen: DLC.

Includes notes on proposed mapping during summer 1956 in the Hardisty Lake uranium area 100 mi. south of Great Bear Lake; coastal reconnaissance and study of Triassic fauna and stratigraphy in Eureka Sound, Ellesmere Island; exploratory reconnaissance of northwest Baffin Island; geologic mapping in Glenlyon, Quiet Lake, and Kluane Lake regions, Yukon; study of pollen deposits from southern Ontario north to James Bay; mapping in the Mt. Wright, Wabush Lake, and Kaniapiskau regions, northern Quebec-Labrador. Copy seen: DGS.

47445. PRECAMBRIAN. Mining progress in Alberta and N. W. T. (Precambrian, Aug. 1956. v. 29, no. 8, p. 22–23)

Includes notes on four lead-zinc discoveries in the Whitehorse region and a nickel-copper discovery near Kluane Lake, Yukon Territory. Other silver-lead, lead-zinc and copper prospects have been found in the Canol Road, Pelly River, and Keno areas, and asbestos in the Canol Road and Dawson regions. A 12,500 sq. mi. area in northern Yukon-Mackenzie District (Eagle Plain reservation-Peel Plateau) is under investigation for oil and natural gas. Geologic work has been underway since 1952 and seismic survey should be completed in 1956.

Copy seen: DGS.

47446. PRECAMBRIAN. North West Territories mineral production. (Precambrian, Feb. 1956. v. 29, no. 2, p. 10, 12.)

Contains summary of 1955 mining operations and production figures for gold, pitchblende products, silver, tantalum pentoxide, crude oil. Exploration for oil and copper in Mackenzie District, and Canadian Geological Survey mapping by helicopter in Mackenzie, Keewatin, and Franklin District are noted.

Copy seen: DGS.

47447. PRECAMBRIAN. N. W. T., Yukon briefs to Commission urge Great Slave Lake Railway. (Precambrian, Jan. 1956. v. 29, no. 1, p. 16.)

Briefs submitted to the (Gordon) Royal Commission on Economic Prospects by Northwest Territories and Yellowknife district ask substantial assistance in construction of a railway from northern Alberta to the south shore of Great Slave Lake; also a road connecting Yellowknife and the Mackenzie Highway. Briefs claim that railroad would bring lead-zinc mine at Pine Point into production, and would pay for itself through taxation on new developments. Brief submitted by Yukon Territory (not discussed) noted climate and transport difficulties in mineral development, present production, taxation.

47450. PRESCOTT, GERALD WEB-BER, 1901— Notes on the ecology of the freshwater algae of the arctic slope of Alaska. (In: Alaskan Science Conference . . 1952. Proceedings, pub. 1954, p. 46.)

Despite uniformity of topography and

climate, the floral composition varies even in closely associated water bodies. Chemical investigation revealed this to be due to differences in pH, phosphorus and calcium. Plants, recognized as indicators of the kind of pond, are listed.

Copy seen: DGS.

47451. PRESTHEGGE, KNUT. Hva husdyrforsøkene viser om laven som för og i ernaering. (Naturen, 1956. Årg. 80, nr. 2, p. 113–28. 3 illus., 2 diagrs., 5 tables.) Text in Norwegian. Title tr.: What research with domestic animals reveals about lichens as fodder and in nutrition.

Experience in World War II increased Norwegian interest in the value of lichens, the so-called reindeer mosses and others, as food for domestic animals. Results of experiments with them are classified and discussed. Restriction of their use to ruminants is established. Botanical analysis of a heath and rate of regrowth are included. Finmark has the widest continuous expanse of these lichens in Norway. Copy seen: DLC.

PREVEDEL, ARTHUR E., see Watkins, D. H., and others. The effect of somatotrophin . . . 1956. No. 48872.

47452. PRĀKHIN, M. I. Opyt kul'tury dekorativnykh rastenii v raione srednei Pechory. (Akademiiā nauk SSSR. Botanicheskii institut. Trudy, 1955, ser. 6, Introduktsiiā rastenii i zelenoe stroitel'stvo, vyp. 4, p. 232–51, 2 tables.) Text in Russian. Title tr.: An attempt at cultivation of decorative plants in the middle Pechora region.

Reports results of experimental cultivation from 1946 to 1953 in the town of Pechora in the taiga region: 48 annual and 16 biennial and perennial species (table 1) were found to grow and bloom in the open, if they are started in the hot house then transplanted into the open in April to mid-May. A few decorative trees and shrubs like balsam maple, Siberian apple-tree, irga, various species of Crategus and Lonicera might be used in parks; they need some cover during cold winters. Flower beds in the city parks are now rather common.

Notes plant formations observed by the author on the Khara-Tas and Yurin-Tas ridge during his trip on the Kotuy River (Khatanga River basin) in 1953. The landscape is typical alpine-tundra: the most common plants are Rhododendron adamsii and Juniperus sibirica; less common species are Festuca supina. Calamagrostis purpurescens, etc.; the plants, including lichens and mosses are listed. Elements of steppe vegetation occur on the slopes: Ptilagrostis mongolica, Carex macrogyna, Festuca supina, etc. Copy seen: DLC.

47454. PRICE, EMMETT WILLIAM, 1896— . North American monogenetic trematodes, II. The families Monocotylidae, Microbothriidae, Acanthocotylidae and Udonellidae (Capsaloidea). (Washington Academy of Sciences. Journal, Apr. 15, 1938. v. 28, no. 4, p. 183-98, 17 illus.) 52 refs.

Contains keys to the subfamilies and genera, and a systematic list of 15 species with diagnoses and data on hosts, locations and distribution. Acanthocotyle williamsi n. sp. (host: skate; location, skin) is described from Aleutian waters (Salt Island). Pt. I of this paper (1937) does not contain arctic material; but pt. III does, infra. Copy seen: DLC.

47455. PRICE, EMMETT WILLIAM, 1896. . North American monogenetic trematodes, III. The family Capsalidae (Capsaloidea). (Washington Academy of Sciences. Journal, Feb. 15, 1939. v. 29, no. 2, p. 63–92, 43 illus.) 51 refs. Contains a systematic treatment of this family, with keys to the subfamilies and genera, synonyms, descriptions of subfamilies, genera and 19 species, of which three are new. Entobdella hippoglossi (Alaska and Greenland) and E. bumpusii (Labrador), are included.

Copy seen: DLC.

47456. PRICE, WILLIAM ARM-STRONG, 1889— and B. W. WILSON. Cuspate spits of St. Lawrence Island, Alaska: a discussion. (Journal of geology, Jan. 1956. v. 64, no. 1, p. 94–95.) 7 refs. Also pub. as: Texas. Agricultural and Mechanical College. Dept. of Oceanography. Contribution, oceanography and meteorology series, no. 54.

Discussion of No. 39825. The problem of the formation of cuspate spits can

probably not be separated from those of resonance and the segmentation of elongated water bodies. Writers suggest that standing-wave oscillations or seiches in enclosed or semiclosed bodies of water might have relation to the existence of spits or sand bars. Tank experiments are briefly described. Both single and paired spits could be associated with the nodal areas of seiches in cases where other activities do not overshadow the work of the seiche.—From authors' abstract.

47463. PROKOF'EVA, E. D. Khanty i mansi. (In: Akademiā nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 570–607, illus. col. plate.) 80 refs. Text in Russian. Title tr.: Ostyaks and Voguls.

Outlines the distribution (mainly Ob' basin), tribal names, languages (also dialects) and history of these ethnic groups. Their exploitation during the centuries of Russian colonization is noted. Population data (1926 census) are given: Ostyaks 17,800, Voguls 5,700; and the native economy and customs of pre-Revolutionary times are described: hunting, fishing, reindeer herding and rudimentary agriculture; food (mainly meat and fish), transportation, settlements and housing, clothing, tribal organization and religious beliefs (ancestor worship, totemism, blood feuds, shamanism). Radical changes followed the Revolution: collectivization (selected data 1931-1953 given on kolkhoz incomes etc.), introduction of new and development of old trades due to research (e. g. acclimatization of new fur animals like muskrat, mink and sable), creation of new industrial or cultural centers, emancipation of women, education, etc. Paper prepared in collaboration with V. N. Chernetsov and N. F. Prytkova. Copy seen: DLC.

47464. PROKOF'EVA, E. D. Nentsy. (In: Akademifa nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 608-647, illus.) 48 refs. Text in Russian. Title tr.: Nentsy.

Gives population statistics for the Samoyed people (16,375 in 1926), their past and present distribution (now roughly 44°-114° E. along the arctic coast, on Kolguyev Island and Novaya Zemlya), tribal subdivisions, linguistic and racial affinities, etc. The native economy (reindeer herding, hunting and fishing) transportation, nomad tents (chum) and camping, food and clothing are described. Social and family organizations, religious beliefs, etc., are outlined. The participa-

tion of Samoved communists in the Russian Revolution is mentioned and basic changes brought about by the Soviet regime are discussed: collectiviza-(virtually completed in 1950), introduction of advanced farming techniques and equipment, settling of nomad herders and hunters, land reclamation, introduction of log and frame houses, education, emancipation of women, disappearance of old taboos, etc. Modern Samoyed scientists, et al., are cited. The pre-Revolutionary period is described from an (unpublished?) article by the late G. D. Verbov and G. N. Prokof'ev. Copy seen: DLC.

47465. PROKOF'EVA, E. D. Sel'kupy. (In: Akademiâ nauk SSSR. Institut étnografi. Narody Sibiri, 1956. p. 665-86, illus.) 19 refs. Text in Russian. Title tr.: The Selkups.

Distribution of this Samoyed people (now mainly in Yamal Peninsula and the Ob' basin south to approx. 58° N.), their racial affinity, tribal names, language, history, etc., are sketched. Population (approx. 6,000 in 1926) data are Their native hunting economy, with reindeer herding among the northern tribes, and customs, the use of draught animals and boats, their food (mainly fish) clothing, settlements and housing (log-reinforced mud houses, etc.), are discussed. The tribal organization (phratries and clans, the latter named after totem animals), class society, position of women (higher than among most other northern peoples), religious beliefs (shamanism, plurality of souls, totemism), folklore, etc., are discussed. The changes under the Soviet regime are described: resettlement of the Sel'kups in the upper Ob' basin between the Narym and the Tym (approx. 69°-80° E.), creation of kolkhozes, with fur animal farming, expansion of fishing and reindeer herding, lumbering, introduction of agriculture and animal husbandry; education, health services, etc. The use of materials written by the late G. N. Prokof'ev is acknowledged. Copy seen: DLC.

47466. PROKOSHEV, V. N. Za vysokie urozhai na peschanykh pochvakh Severa. Berezniki, 1941. 26 p. tables. Text in Russian. *Title tr.:* For high crops on the sandy soils of the North.

Account of activities of the Agriculture Experiment Station at Solikamsk (approx. 59°30′ N. 56°40′ E.) in acclimatization of wheat and increasing potato

crops. The report covers a period of 12 years. Successive sections deal with introduction of wheat into the North: preparation of soil, melioration, sowing and sowing periods, crops; improving the potato yield, soil preparation, melioration, etc.; alkalizing the peat soils; green fertilizers; mineral fertilizers and their effective use, including use of local potash; utilization of science. 47471. PUCKETT, LOWELL M. Public land policy as it affects social and economic development of Alaska. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 164–68.)

Describes U. S. policy in public lands disposal since the Revolution; the homestead law of 1862 was extended to Alaska in 1898, and most land privately held has been granted under its terms of farming and habitation. Due to veterans' exemption and others' evasion of the cultivation requirement, also to some homesteaders' poor choice of sites (without regard for roads, markets, climate, soils), full-time farmers are the exception and only some 12,000 acres are tilled. Recent land use studies by the Bureau of Land Management are described: its surveying and opening of small tracts (average 11/4 acres) for homesites near cities, and social and economic changes resulting from these new policies, are reviewed. Copy seen: DGS.

47472. PUDOVKIN, I. M. Magnitnye variatsii v vysokikh shirotakh. (Akademita nauk SSSR. Izvestifa, serifa geofizicheskafa, July 1956, no. 7, p. 83537, graphs.) Text in Russian. Title tr: Magnetic variations in the high latitudes.

English translation with notes by E. R. Hope, pub. by Defence Research Board of Canada, Directorate of Scientific Information Service, Ottawa, Nov. 1956, its: T233R, (5 p.) copy at CaMAI.

The magnetic field variation was recorded at seven Soviet stations located between approx. 67° and 73° N. lat. during the period July 1–Sept. 30, 1953. Variations were found to be due to causes having an extremely non-homogeneous structure. No new experimental results were noted. To make further progress in understanding the nature of geomagnetic variations, several years' recording of high-latitude variations will be required at a group of stations 200-300 km. apart. Copy seen: DLC.

47473. PUDOVKIN, I. M. O variafsifākh magnitnogo polfā pri proizvodstve tochnykh regional'nykh aėromagnitnykh s''emok. (Akademifā nauk SSSR. Izvestifā. Serifā geofizieheskafā, 1956. no. 8, p. 997–98, table, diagr.) Text in Russian. Title tr: Variations in the magnetic field during precise regional aeromagnetic surveys.

Contains discussion supplemental to No. 47472 and correction of data on variations according to time and region (diagrams, table). The corrections are applicable in both polar regions.

Copy seen: DLC.

The climate of the general area north of 60° N. and between 10° and 170° E. is described under three broad headings: dynamic and aerological climatology, surface climate, and climatic changes. The general circulation patterns near the surface and aloft, and their meteorological

and climatic effects are discussed. Seasonal weather phenomena and the occurrence and distribution of clouds, fog, snow, permafrost, and river ice are included. Trends in winter and annual temperatures are cited to support the belief that the climate of the region became milder in the 20th century. A list of stations used and their geographical coordinates are included.

Chipewyan and Herb Lakes, Manitoba.
(Precambrian, 1956, v. 29, no. 10, p.
6–14; no. 11, p. 6–12; and 1957, v. 30, no.
1, p. 28–33, illus., text map.) 61 refs.
Summary in Mining magazine, Dec. 1956.

v. 95, no. 6, p. 372-74.

The 24,500 sq. mi. area (54°53'-58° N. 97°18'-100°17' W.), includes Big Sand Lake, Southern Indian Lake, and Churchill River basins; its exploration and mapping 1793-1955 are described. Elevations above sea level range from 850 ft. in the southwest to 1,100 ft. in the northwest. The northern half is characterized by many large eskers, kames, and more abundant bedrock outcrops than the southern half. Permafrost occurs in low ground. The Precambrian bedrock consists (oldest to youngest) of volcanic and sedimentary rocks, sedimentary and mixed gneisses, granitic rocks (which predominate), basic and ultrabasic intrusives, and granitic pegmatite and aplite. volcanic-sedimentary rocks, gneisses, and granites have undergone at least two periods of deformation, and display complex folding. The two major northeasttrending faults, the volcanic-sedimentary belts, and the basic intrusives are most favorable for base metals, but gneiss areas are also under investigation. erals found to date are listed, and locations of occurrences (74) are listed and described. Copy seen: DGS.

47487. QUINN, HAROLD ARTHUR, 1911- . Mineral occurrences in Manitoba. (Western miner, Aug. 1956. v. 29, no. 8, p. 38-41, illus., text map.)

Contains description of areas 55°-58° N. 98°-100° W., east of the Sherridon-Lynn Lake railway, and including the basins of Northern and Southern Indian Lakes (expansions of the middle reaches of Churchill River). Exploration and drilling there followed discovery in 1945 of nickel-copper ore at Lynn Lake. Surface formations and general geology are described. Most of the region is underlain by granitic rocks and by granitized and hybrid gneisses. However, several belts of volcanic and sedimentary rock favorable for metallic

mineral occurrences have been found. Ten mineral localities are described.

**47488. R., P.** Exploring Greenland. (WMO bulletin, July 1956. v. 5, no. 3, p. 118-19.)

In Apr. 1956, plans were made in Switzerland for International Glaciological Expedition to Greenland, 1957-1960. Sponsored by Commission for Snow and Ice, International Association of Scientific Hydrology, and led by P-£. Victor, it will be coordinated with the IGY program. Meteorology, glaciology, geophysics, and geodesy will be studied by parties on both coasts and the inland ice. Previous expeditions from 16th to 20th centuries are noted.

Copy seen: DWB.

47489. RÅSTAD, H. Erfahrungen über Vereisung von Fernleitungen in norwegischen Gebirgen (Auszug). (Wetter und Leben, Jan. 7, 1955. Jahrg. 7, Heft 8-11, p. 196-99.) Text in German. Title tr.: Experience with icing of trunk lines in Norwegian mountains (excerpt).

Contains discussion of factors influencing ice formations on overhead lines on the basis of investigations in southern Norway. Selected examples are given. The factors examined include: elevation, topography, wind, temperature, and wire diameter. Little or no ice formation was observed in areas protected from the wind by a terrain elevation of 50 m. while on lines exposed normally to the wind, ice reached up to 14 kg./m. No definite relation between ice loads and elevation was found other than a temperature effect. No effect of wire diameter on ice loads was noted. The maximum ice deposit recorded was 90 cm. in diameter. Copy seen: DLC.

47490. RABOT, CHARLES, 1856-1944. Au Cap Nord; itinéraires en Norvège, Suède, Finland. Paris. Librairie Hachette et Cie., 1898. (328 p. 10 illus., 23 plates, 4 maps incl. 1 fold., 14 tables.) over 40 refs. in text. Text in French. Title tr.: To the North Cape; itineraries in Norway, Sweden, Finland.

Composite account of six summers' excursions (1880-1885) in arctic Scandinavia, partly in journal form. Landscapes and their geomorphology, climate, flora and fauna, inhabited places and occupational developments are treated, as well as the diverse national and racial

groups, social forms, degree of culture, and adaptation to environment.

A coastal journey from Trondhjem to Nordkap is described (p. 1-62) with topographic details of the strandflat and mainland as seen from the sea; the three arctic provinces of Norway, Nordland, Troms, and Finmark are differentiated; changes in sea level, agricultural activities, forest, glaciers, fisheries, administrative services, the Lapps and their distribution, are treated in turn.

Chap. 3 deals with the lakes and glaciers of southern Nordland; the topographic development of northern Scandinavia is reviewed, mountain, continental (plateau), and intermediate glaciers are distinguished. Detailed account is given of journeys in 1882 and 1883: from Mosjøen, on the Vefsnfjord, to the Store Børgefjell plateau, and from Korgen in Ranfjord to the Okstind locality on the Norwegian-Swedish border, with local place names, topographic description, elevations, and the nature of human occupance.

Rabot's explorations of Svartisen and adjacent glaciers, between Beiarnfjord and Ranfjord are recounted (p. 99-140) with map showing distribution of all ice fields. These he attributes to over-abundant precipitation rather than

cold climate.

Chap. 5 treats of the Lapps, their numbers, distribution, clothing, occupation and habitat, also possible origins of the Reindeer husbandry, its term, Lapp. animal, insect, and epizootic risks; the regimen, winter and summer forage plants; fishing and its seasonal hardships; sedentary occupations and the need for some changes from traditional Lappish ways, are discussed. classic description is given (p. 165-231) of Swedish Lapland, which reaches south as far as 64° N. From the mountainous coast of Norway, eight passageways are indicated to the eastern slope of northern Sweden, which is described topographically in decreasing elevation as mountain, lake or bog, forest, and coastal land. Each of these is distinguished at various localities along courses of the Ume, Pite, Lule, Skellefte, Kalix, and Torne Rivers. Changes resulting from ore mining and railroad building are considered. Major topographic elevations of the Gällivare, Sarek, Kebnekaise, and Sulitjelma localities are described, and their glaciers classified.

Chap. 9 describes coastal Norway north of the strandflat; fishing and whaling ac-

tivities of Svend Foyn; the bird colony of Svaerholtklubben; role of coastal sites and activities in the colonization and development. The treelessness of certain localities is attributed to effects of the wind. Northeasternmost Norway is treated in chap. 10: its geography and intermingled people. Strandlines are measured at several places and a difference in land elevations is noted along the coast and between coastal and interior locations. Tundra and forest are described in Varangerfjorden and the Pasvik valley. Russian Lapps are described, and the term "Skolt" (Norwegian for "skull") is related to their Russian custom of shaved heads. Among the many localities described throughout the book is Boris-Gleb, the Skolt village, which Rabot visited on his journey up the Pasvik River to Lake Inari in Finland.

Appended (p. 307-326) is practical information for the traveler on fjord trips, overland tours, mountain ascents, yacht cruises, also hunting and fishing excursions. Equipment, means of travel,

expenses, etc., are noted.

47501. RAEFF. MARC. Siberia and the reforms of 1822. Seattle, University of Washington Press, 1956. xvii, 210 p. text map. (University of Washington publications on Asia.) Approx. 200 refs.

Analysis of factors in change of Siberia from a neglected and exploited colony in the 16-17th centuries to a valuable province and organic part of Russia in the 19th. Emphasis is laid on the change in political attitude towards Siberia of Russian statesmen in the reign of Alexander I and the resulting legislation which culminated in the statutes of 1822. In two parts, the book deals first with the Russian population in Siberia: administration, social and economic life from the 16th century to 1805, during the governorships of Pestel and Treskin 1805-1819, and Speranskil from 1819; the statutes of 1822, political, social and economic consequences. The second part takes up the situation of the native peoples of Siberia (including those of the far North) during the same period, changes in social and economic conditions and in native administration. pendices deal with agriculture among the Buryats, Speranskii's views on freedom of trade, organization of the Siberian administration, and classification of na-Bibliography lists source tive peoples. material, contemporary works and periodicals, secondary works; the Russian administration and Siberian natives are specifically covered.

47504. RAKHMANOV, V. V. Vlifanie lesov na formirovanie snezhnykh zanosov. (Meteorologifa i gidrologifa, Nov. 1956, no. 11, p. 21-28, tables, graphs.) 24 refs. Text in Russian. Title tr.: Influence of the forest on formation of snow cover.

Snow accumulation in forest and field is analyzed on the basis of observations from 84 hydrometeorological stations and posts in European and Siberian U. S. S. R. and comparisons are made with earlier data. The accumulation is evaluated in terms of height and density of snow cover, represented by height (mm.) of the water layer in a sample snow column of the same diameter. The coefficient of snow

accumulation is represented by the ratio of water (mm.) in the forest sample to that in the field sample. The average ratio for different regions varies from 1.14 to 1.21. Snow accumulation in forests is generally higher (10–30 percent) than in fields. Variations in the coefficient are attributed to the character of the forest (coniferous or foliate) and by average climatic changes during winter.

French. Title tr.: Mechanism of formation of pegmatites in West Greenland.

Contains description of pegmatites in gneisses and schists between 64° and 69° N. along the west coast of Greenland. Pegmatites resulting from volume-by-volume replacement of other rocks and from growth in dilating fissures are discussed; also evolution of ptygmatic folding and "pinch-and-swell" structures. Evidence indicates that both types of pegmatites are formed by diffusion through the host rock, that the host rock is the source of the pegmatite material. Discussion follows the text (p. 34–36).

Deals primarily with the mechanics of formation and experimental studies of the structures. Mention is made of boudinage structures observed in West Greenland (no location given), with nine photographs.

Copy seen: DGS.

47512. RAMBERG, HANS, 1917—. Pegmatites in West Greenland. (Geological Society of America. Bulletin, Feb. 1956. v. 67, no. 2, p. 185–213, 45 illus. on 11 plates, text map, diagrs., cross-sections.) 14 refs.

Numerous quartz-feldspar pegmatites occur in the gneisses and crystalline schists of West Greenland, between Ivigtut and Jacobshavn Isfjord (61°-69° N.). Some are volume-by-volume replacement bodies, others formed by slow growth in dilating fissures. The nondilation and dilation pegmatites were emplaced by similar mechanism, viz.: diffusion through the host rocks and through fissures. Field evidence is against bodily flow of pegmatite magma and crystallization from a stagnant magma. Tension joints and shear zones have commonly localized pegmatites, but other structural heterogeneities such as pre-pegmatitic dikes and inclusions in gneisses were also "sinks" for the diffusion currents of pegmatite-forming matter. Ptygmatic folding and pinch-and-swell structures are results of tectonic deformation simultaneous with, or later than, the formation of pegmatite.-From author's abstract. Copy seen: DGS. 47513. RAMOS, J. GARCIA. Ventricular fibrillation in artificial hypothermia. (Journal of thoracic surgery, May 1956. v. 31, no. 5, p. 635-42, illus.) 12 refs.

Account of study on rats which showed "that lowering the temperature of the animal increases the heterogenicity of the ventricular muscle making it more apt to present ventricular fibrillation." This change is attributed to lowered oxydative reactions and reduced irrigation of the heart. Copy seen: DNLM.

**47514. RANDIĆ, LEO.** A device to determine position rapidly without calculation. (Institute of Navigation, London. Journal, Jan. 1956. v. 9, no. 1, p. 11–16,

diagrs.) 2 refs. Contains description and diagrams of a small telescope to which a bubble is attached. The device turns the invisible zenithal point into a visible spot in order to render possible determination of the observer's longitude and latitude by a determination of the right ascension and declination of the observer's zenith. Four or five film strips containing about 100 star charts each suffice for the whole sky with an accuracy of one minute of arc. Stars and constellations need not be known since only the coincidence of star images is of interest. The device is suitable for polar regions, during the polar night, where the accuracy of the usual sextant is low due to the small changes in star altitude. The accuracy of position determination by means of the device is equal to that of bubble position on the celestial sphere, and it is the same in higher latitudes as in the equatorial regions. 47517. RANSOME, ALFRED L., and W. H. KERNS. Names and definitions of regions, districts, and subdistricts in Alaska, used by the Bureau of Mines in statistical and economic studies covering the mineral industry of the Territory. Washington, D. C., May 1954. 91 p. 16 text maps. (U. S. Bureau of Mines. Information circular 7679.) approx. 700 refs.

A presentation for the mineral industry and individuals interested in the mineral or allied industries in Alaska. Need for standardization of names and the development of the system are discussed. Fourteen regions (subdivided by districts and subdistricts) are listed alphabetically. Area and boundaries of each region and its subdivisions are defined and shown on accompanying index maps, with references to selected publications on the area concerned. Map references are limited to the U.S. Geological Survey's miscellaneous Alaska Special maps and recent Alaska Reconnaissance Topographic Series, scale 1:250,000. Appended alphabetical indexes to regions and their subdivisions cover both text and index maps. Copy seen: DGS.

**47518.** RANSOME, ALFRED L., and W. H. KERNS. The problem of standardizing names and definitions of geographic regions and mining districts in Alaska. (*In:* Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 170–72.)

A scheme for designating geographic locations (as distinct from features) is required, together with definition of terms "area," "region," "mining district," and "precinct," as part of the designation. A plan for standardizing names and definitions is in preparation by the Mineral Industry Division of the Bureau of Mines, Region I; generally accepted names being retained if possible. Its preliminary report describes 14 regions, named for large geographic features; 71 districts, named for mining areas; and 101 subdistricts, named for drainage basins. Copy seen: DGS.

refs.

An extensive study based on field work conducted during 1944-47, and on sampling continued at a central station through 1954. Taxonomic, gravimetric and numerical evaluations of nearly 500 samples are presented, with comparisons between the larger, open lake and the deep, cold, east arm. Seasonal and vertical distribution of the plankton were worked out and the dominant forms among the algae, rotifers, Cladocera and copepods studied as to their frequency in the Lake. Species composition of the phyto- and zooplankton is determined and a closer identity of the dominant forms with those of Lake Winnipeg, Nipigon and the Great Lakes established. Copy seen: DI.

47535. RAY, CARLETON. The Alaskan snow flea. (Natural history, Mar. 1956. v. 65, no. 3, p. 128-29, illus.)

"Snow fleas or Collembola found in the middle of Lemon Creek Glacier are described, and their survival in snow is discussed. As many as 120 insects were counted per sq. ft. of snow in sunny weather with temperatures of 45° F. or higher; they disappeared into the snow during wind, precipitation, and at dark, retreating into tunnels and caverns under surface. Snow fleas remain active even at the f. p. and live on pollen and snow algae. Various hypotheses on the wintering of these insects are suggested."—SIPRE. Copy seen: DLC.

47536. RAY, LOUIS LAMY, 1909—. Perennially frozen ground an environmental factor in Alaska. (In: International Geographical Union. Eighth General Assembly and Seventeenth International Congress, Washington, D. C., Aug. 8–15, 1952. Proceedings, pub. 1956? p. 260–64.) 9 refs.

With growth of permanent settlements, extension of agriculture and construction, an understanding and utilization of

permafrost becomes imperative, as it underlies about 60 percent of the area mainly in the interior and north. The permafrost zone and the active layer are Zones of continuous, disdescribed. continuous, and sporadic permafrost are explained, and the relationship indicated between permafrost and local relief, soils, vegetation. Land clearing and construction on underlying permafrost disturb the equilibrium of the environment, but the deleterious effects may be controlled. Copy seen: DGS.

47541. REDFIELD, W. C. Ice in the North Atlantic. (In: Blunt, G. W. Memoir of the dangers and ice in the North Atlantic Ocean, Washington, 1868.

p. 12-19, fold. map.)

The dangers of ice to navigation and the trend of polar-ice drifting are discussed on the basis of observations dating back to 1832. Ship reports on ice conditions are reproduced, including location of the ice, its extent, types, iceberg characteristics, and difficulties encountered. The effects of polar currents and the Gulf Stream on the drift and distribution of ice are examined in detail. Ice conditions in the North Atlantic from 1737-1859 are mapped.

47542. REDMYER, HEDLEY E. Reindeer in Alaska. Translated and edited by Sverre Arestad. (Pacific Northwest quarterly, July 1951. v. 42, no. 3, p. 211-23, text map.) 5 refs. Condensed translation from Skandinaven July 31, 1899 (Norwegian-American newspaper formerly pub. in Chicago), with

introd. by the Editor.

Redmyer, with a crew of six (including five Lapps from Norway), drove the introduced reindeer from Haines in Southeast Alaska, north through Yukon to Circle (65°50' N. 144°04' W.). The animals were part of a herd of more than 500 purchased by the U.S. War Dept. in Norway and shipped to Seattle, thence in Mar. 1898 to Haines where by Apr. 15, 362 had died from hunger. Redmyer started his drive May 6, 1898 with 185 deer, and arrived in Circle Feb. 28, 1899 with 114. Difficulties and dangers of the trip are described.

47543. REED, EDWARD B. Notes on some birds and mammals of the Colville River, Alaska. (Canadian field-naturalist, July-Sept. 1956. v. 70, no. 3, p. 130-36, text map, table.)

Contains field notes on 48 species of birds and eleven mammals (grizzly bear, wolverine, red fox, arctic fox, gray wolf, harbor seal, Alaska moose, etc.) observed along 450 miles of the Colville River during the summer 1955. A description of the region and a table of distributional data on birds recorded during the trip, are added.

Copy seen: DA.

47544. REED, JOHN CALVIN, 1930—, and J. C. HARMS. Rates of tree growth and forest succession in the Anchorage-Matanuska valley area, Alaska. (Arctic, 1956. v. 9, no. 4, p. 239–48, 4 illus., text map, diagrs., graphs.) 4 refs.

Results of vegetation study by U. S. Army Map Service in summer 1955 in the area 61°07'-45' N. approx. 149°-150° W., from sea level to tree line at 1,500-2,000 Eight principal forest cover types were distinguished. Sixty-five test plots were laid out, in which trees were counted, diameters and heights measured, and ages determined. Most important factors controlling distribution of species are altitude, drainage, fires, regenerative ability of species after fires, frequency of flooding; soil type and surficial geology are relatively unimportant. Growth rate depends on amount of sunlight and drainage; cottonwood and aspen have highest rates, birch and white spruce lower, black spruce lowest. Mixed birch-white spruce forest is generally self-perpetuating. Copy seen: DLC.

47545. REED, JOHN CALVIN, 1905—. The use of airplane photographs in the geologic study of the Chichagof mining district, Alaska. (Photogrammetric engineering, Jan.—Mar. 1940. v. 6, p. 35–44,

illus.)

Contains information on how the photographs were used and what geologic information was obtained that would have been otherwise more difficult or impossible to get. Multiple lens photographs taken

in 1926 and 1929 were used during the 1939 field season in this area of Southeast Alaska. Their principal use was in study of the structural features. Many of the faults with slight surface expression would have been unidentifiable without the aerial photographs. *Copy seen:* DLC.

v. 67, no. 12, pt. 2, p. 1727).

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31-Nov. 2, Ross Mt. (57°25' N. 70° W.) lies in the northern part of the Upper Precambrian Quebec-Labrador geosyncline. Stratigraphic section from the base up includes 50 ft. of shaly magnetite chert, 100 ft. of interbedded lenticular chert and cherty siderite, and 125 ft. of bedded to massive cherty quartzite. Mineral constituents are noted. Minerals were formed by primary chemical precipitation or during early authigenesis.

47557. REMPEL, R. C., and R. GANG. Crevasse detection studies; final report, 21 May 1955-21 February 1956. Palo Alto, Calif., Varian Associates, Feb. 1956. 39 l., illus., diagr., graphs. (Engineering report no. 165-4). Prepared for U. S. Army. Engineer Research and Development Laboratories, Ft. Belvoir, Va., on Contract no. DA-44-099 eng-2570, Project no. 8-98-09-002A.

The results of studies on the Greenland Icecap on the transmission characteristics of microwaves in snow and ice as a function of frequency, the most favorable operating frequency for a microwave crevasse locator, and the performance of single- and crossed-beam microwave detection systems are reported. A rapid increase of attenuation with increasing frequency and moisture content was Attenuation measurements innoted. dicated that the FM system was superior to the crossed-beam system, one advantage of the FM detector being that no contact with the snow surface is needed. For successful operation of the crevasse detector, the attenuation must be less than 0.5 db./ft., the center frequency less than 3 kmc., and the band with 300 me. A block diagram of an FM crevasse detector is given, and its various components and spectrum analyzers are discussed.—From SIPRE.

Photographs, with notes, representing the 1949 expedition which established camp at 71° N. 40° W. Various uses made of light metals and metal alloys in the expedition's equipment are stressed. The applications shown include skis and sleds, radio equipment, prefabricated buildings, and supply containers designed for air drop. Copy seen: DLC.

47569. REZVOĬ, PETR DMITRIEVICH. Trichasterina bispiculigastra novaſa shestiluchevaſa gubka iz Barenſsova morſa. (Leningrad. Leningradskiĭ nauchnyĭ institut imeni P. F. Lesgafta. Izvestíſa, 1923. nov. ser., t. 7, p. 35–37.) Text in Russian. Summary in German. Title tr.: Trichasterina bispiculigastra, a new hexactinellid sponge from the Barents Sea.

Description of an incomplete specimen found at 72° N. 33°30′ E., and 266 m. depth by Derûgin during a trip in 1921 along the Kola meridian (cf. No. 3891). Characteristics differentiating it from the most closely related form, *T. borealis* F. E. Schulze, are also discussed.

Copy seen: DLC.

47570. RHL, H. V. En vintertur till Harsprånget, April 1891. (Svenska turistföreningen, Stockholm. Årsskrift, 1892, p. 256–58.) Text in Swedish. Title tr.: A winter journey to Harsprånget, April 1891.

Winter conditions still prevail in the waterfalls of northern Sweden in April; limited water supply and ice-covered outcrops are the main characteristics contrasting with summer conditions. Travel accommodations from Gällivare to Aborrträsk are noted.

\*\*Copy seen: DGS.\*\*

RHODE RUSSEL, see Ederstrom, H. E., and others. Correlations . . . skin temperature and blood flow . . . dog. 1956. No. 44722.

47571. RÂBININ, BORIS STEPAN-OVICH. Lîubitel'-sobakovod; sovety nachinafushchemu. Molotov, Molotovskoe knizhnoe izd-vo, 1955. 159 p. illus. Text in Russian. *Title tr.:* The amateur dog breeder; advice for a beginner.

Basic principles of dog breeding are explained: selection of breed and choice of puppy; housing and feeding the animals; training them; dog diseases; education of dog breeders, etc. The Siberian husky is described as an outstanding northern breed (p. 31–32) and its services in the recent Soviet arctic expeditions are noted.

Contains account of experiments with dogs which demonstrated that sino-auricular blockade with procaine is very effective in preventing ventricular fibrillation in dogs made hypothermic and subjected to various cardiac stimuli. Parts 2, 4 and 5 of this series were listed as No. 42074A, 42074B, 47981.

Copy seen: DLC.

47574. RIBERI, ANGELO, and others. Ventricular fibrillation in the hypothermic state, 3; the management of coronary air embolism and ventricular fibrillation. (Archives of surgery, Mar. 1956. v. 72, no. 3, p. 502–507, illus., tables.) 5 refs. Other authors: H. Kajikuri and H. B. Shumacker, Jr.

Contains a study of the two potential complications of hypothermic cardiac surgery: air embolism and ventricular fibrillation; and means of their prevention and therapy. A series of means is presented against embolism; electric shock and, to a lesser degree, sino-auricular node blockade proved effective against fibrillation. Copy seen: DNLM.

Based on No. 28139, summary account of exploration of the island in the 17th–20th centuries, physical geography, geology, effects of Pleistocene glaciation, the Sadlermiut Eskimos who died out in 1902–1903, and present inhabitants, the Aivilik and Okomiut Eskimos, who numbered 238 in 1951.

Copy seen: DLC.

47576. RICE, ELBERT F. Destruction of piling by marine borers. (*In:* Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 22–24.)

The several kinds of borers active in Alaska and their damage to wooden marine structures are outlined, and control methods are discussed briefly. The only effective control methods are full-cell creosote treatment and concrete coatings. Creosoted wood may be expected to last 30 years or more in salt water as compared with two to five years for untreated wood.

Copy seen: DGS.

47577. RICH, EDWIN ERNEST, 1904 - Which Jolliet? (Beaver, Autumn 1956. Outfit 287, p. 18–21, illus., text map.)

Describes French mission of Louis Jolliet in 1679 to investigate the Hudson's Bay Company's position on James Bay. There is evidence that his brother Zacharie sailed around Labrador and into Hudson Bay in the same year with a certain La Lande; they traded furs with the Indians, then with the Governor of Hudson's Bay who received them hospitably. Another voyage was made, and in 1685 when a French expedition was sent against the English, Zacharie Jolliet warned the posts at Rupert River and Albany in advance.

47578. RICH, WILLIS HORTON, 1885— . Migration of salmon in the Alaska Peninsula region. (Washington Academy of Sciences. Journal, Oct. 4, 1924. v. 14, no. 16, p. 397.)

Investigation by the Alaska Fishery

Reservation 1922–1923 showed that red salmon taken near the end of the Peninsula and along its southern shore belong mainly to the Bristol Bay run. Apparently the feeding grounds are along the continental shelf of the North Pacific, and on the return migration to home streams in the Bristol Bay, the fish pass through Isanotski Strait.

High grade iron ore reserves total about 3 billion tons in the Kiruna (67°51′ N. 20°13′ E.) and Gällivare (66°10′ N. 20°35′ E.) regions and several unmined deposits. Ore averages 1.0–2.0 percent phosphorous and 60–68 percent iron in the unconcentrated form. Iron of most deposits is almost entirely magnetite, but hematite makes up about 20 percent of the Gällivare ore and most of the Rektor ore body (Kiruna). Geology and formation of the Kiirunavaara and Rektor ore bodies of the Gällivare district, and ore bodies of the Gällivare district

(Stora Malmlagret, Koskullskulle, Kaptenslagret) are described. The geologic history and environments of these ironapatite deposits are similar. Differences may result from rate at which volatiles escaped from the respective magmas or to original differences in nitrogen oxide content. Copy seen: DGS.

47584. RIETZ, E. B. Considerations in the operation of outdoor oil circuit breakers under low ambient temperatures. (American Institute of Electrical Engineers. Transactions, Aug. 1953. v. 72, pt. 3, p. 787-93, illus., tables, graphs, maps) discussion by F. A. Lane and E. B. Rietz.

The effect of low temperatures on materials used for the design of oil circuit breakers and on the operation of these devices is reviewed, after indicating average minimum temperatures recorded in the United States for 47 years. The characteristics of materials such as oil, air, molded plastics, laminated plastics, rubber-like materials, porcelain, ferrous metals, non-ferrous metals, and concrete at low ambient temperatures are re-Operation and maintenance viewed. Heating units problems are discussed. must be used on air-operating mechanisms at temperatures below 32° F., and outdoor oil circuit breakers require special consideration where the average daily temperatures for the coldest month are 20° F. and below.

47587. RIKHTER, GAVRIIL DMI-TRIEVICH, 1889—. Po@vlenie snezhnogo pokrova. (Priroda, Nov. 1956, no. 11, p. 123–24, text map.) Text in Russian. *Title tr.:* The appearance of snow cover.

Mean dates of the first snow cover are mapped (isolines) for European and Asiatic U. S. S. R. The first snow rarely stays throughout the winter, except in the far North of European Russia and northeastern Siberia. Usually snow melts four-five times in southwestern and southeastern European Russia, and three times in the Northwest before the winter settles in. This "pre-winter" period of 30-70 days in most of European U. S. S. R., is often lacking in the northeastern part and in northeastern Siberia.

47588. RIKHTER, GAVRIIL DMITRIE-VICH, 1889—. Prirodnye usloviía Srednego Priangar'ía i basseina verkhneí Leny. (Akademiá nauk SSSR. Institut geografii. Trudy, 1955, vyp. 64, Materialy po fizichesko! geografii SSSR, 1, p. 105–159, illus., 2 fold maps.) 51 refs. Text in Russian. Title tr.: Natural conditions of the Middle Angara region and upper Lena River basin.

A general geomorphic description of the Angara-Lena region, approx. 53°20′-57°20′ N. 98-108° E., is offered, based in part on data from a reconnaissance in 1950 headed by the author. Plans for Angara power development to promote industry in adjacent areas prompt this presentation. The natural districts (19) are distinguished and grouped in geomorphic types: forest-steppe, plain,

southern-, middle-, and northern-taiga, and the Baykal mountainous zone. Orography (relief), stratigraphy, lithology, mineral resources, hydrology (of rivers and marshes), soils and vegetation are outlined for the region as a whole and for each district in turn. Distribution of the population and economic potential of the region (mineral resource, forest, water power development) are noted. Fold. maps show orography and natural divisions of the region.

47589. RILEY,PHILIP A., Jr., and others. Ventricular fibrillation during hypothermia; tolerance of the hypothermic dog heart to ventricular fibrillation. (Archives of surgery, Dec. 1956. v. 73, no. 6, p. 985-88, tables.) 4 refs. Other authors: T. G. Barila and C. W. Hughes.

Account of experiments with dogs made hypothermic till fibrillation occurred and resuscitated after 30 minutes of fibrillation; one group of these animals had a pulmo-aortic fistula made, another was made cyanotic by heart surgery, and a third served as control. The last two groups had a high rate of revival (92 percent); of the first one, only 53 percent survived. It is suggested that failure to develop and maintain an adequate blood pressure following defibrillation is the cause of high mortality in that group.

Serifa geologo-pochvennykh nauk, no. 34, vyp. 7, p. 100–114, diagrs., illus. tables.) 4 refs. Text in Russian. Summary in English. Title tr.: Crystallographic investigation of the ramsayite from the Punkaruayv mountain in Lovozerskaya tundras.

The ramsayite was found by A. E. Fersman in 1921 and studied further by the author in 1936. The crystals of ramsayite were collected in small lensshaped bodies, bedded in lujaurites. These bodies consist of lamellar albite, containing eudyalite, ramsayite, murmanite, zeolites, schizolite and neptunite. The results of the goniometric measurement of crystallic ramsayite disclosed new data on the crystallographic properties (cf. illus. and tables). Reduced gnomonic projection of all observed forms and rays is shown (fig. 4, p. 109). These small, clean and perfectly developed ramsayite crystals are studied for the first time. Copy seen: DLC.

47592. RINGDAHL, OSCAR, 1885—. Flugor: Diptera brachycera. (In: Sjöstedt, Y. Insektfaunan inom Abisko nationalpark, III, pub. in Svenska vetenskapsakademien. Skrifter i naturskyddsärenden, 1931, nr. 18, p. 1–32, tables.) Text in Swedish. Title tr.: Flies: Diptera Brachycera.

Of the dipterous fauna studied around Abisko and neighboring regions west of Torneträsk, the family Muscidae received most attention; this report therefore is somewhat uneven and incomplete. Species differ greatly from those of southern Sweden; annual variation in numbers is noticeable. Of the 570 tabulated, with locations where collected, those found in restricted alpine, subalpine, and other habitats are differentiated. Appended is a simple list of some hundred species collected by K. H. Forsslund in Abisko nationalpark in 1930, with note of location, date, habitat.

47601. RITCHIE, J. C. Studies on the flora and vegetation of the taiga zone of northern Manitoba. (Arctic, 1956. v. 9,

no. 3, p. 211-12.)

In the Seal River area at 59°03′ N. 96°47′ W. during June-Aug. 1956, vascular plants, mosses and lichens, tree height and diameter data and increment cores were collected; detailed descriptions and quantitative analyses of vegetation types were compiled, and various edaphic studies were made. The region lies within the Precambrian Shield at the transition between continuous forest and forest-tundra. Plant communities in glacial till-covered areas, on the large esker traversing the region, and along rivers are noted. Copy seen: DLC.

Contains a brief account of the topography, geology and climate, followed by an ecological study of the region. The predominant and stable forest of mesic sites is dominated by Picea mariana, with a ground vegetation composed chiefly of weft-form mosses (tables 1-3). Pinus banksiana dominates various forests of outcrop ridges, sand plains and eskers (tables 4-7). Picea glauca is rare in the The vegetation conforms with descriptions of the southern spruce forest zone of eastern Canada. A highly local community of Betula papyrifera var. neoalaskana on organic ridges is described. Copy seen: DLC.

47603. RITCHIE, J. M., and R. W. STRAUB. The effect of cooling on the size of the action potential of mammalian non-medullated fibers. (Journal of physiology, Dec. 1956. v. 134, no. 3, p. 712–17. illus.) 8 refs.

Account of experiments with fibers from the whole cervical sympathetic trunk of the rabbit. A fall of temperature caused an increase of action potential; the greatest effect observed was a 1.8 times increase in spike height for a temperature drop of 10° C. The effect of cooling depended on conduction distance.

47609. ROBERTS, PALMER W. Emergency, temporary, and semipermanent housing for polar areas. [Washington, D. C.] 1956. 2 p.1., 28 p. illus., diagrs., tables. (*In*: U. S. Office of Naval Operations. The dynamic North,

v. 2, no. 6.) 19 refs.

Standards for the construction of shelters and buildings in arctic and subarctic areas are presented. The use of snow for building shelters is described, building of snow caves, snow houses, earth and wood houses is described and diagrammed; types of tents and their features are discussed. Building design criteria are considered, particularly for insulation, condensation and ventilation; thermal properties and vapor transmission rates of various building materials are tabulated. The use of wanigans, Jamesway huts, and of prefabricated housing is discussed, with emphasis on the erection and efficiency of modern prefabricated structures such as the Quonset hut, stressed skin plywood buildings, and the military arctic hut. Copy seen: DLC.

47610. ROBERTS, PALMER W. Employment of Eskimos by the Navy at Point Barrow, Alaska. (In: Alaskan Science Conference . . 1952. Proceedings, pub. 1954, p. 40–43.)

The possibility of utilizing Eskimo personnel in the Naval Petroleum Reserve was investigated in May 1946. They were well qualified as guides, and capable of all camp duties. With a little training they would work well as laborers; carpenters, tractor drivers, warehousemen, oilers, and as helpers for electricians, plumbers and drillers. With a minimum of supervision they would be able to handle the more specialized jobs of

small boat, landing craft, grader and dozer operations. The high incidence of tuberculosis involved full medical examination for insurance purposes; but the 35 Eskimos initially hired in July increased to 80 during August, then decreased to 56, as tasks were completed. A description of the procedures invoked to improve health and living conditions of the Eskimos employed is included.

47612. ROBERTSON, O. C. S. Sea navigation methods in northern Canada. (United States Naval Institute, Annapolis, Md. Proceedings, Aug. 1956. v. 82, no. 8, p. 892–96, illus.) Also pub. in: Crowsnest, Aug. 1956, v. 8, no. 10, p. 5–7, illus.

The majority of the navigation problems in Canadian Arctic waters derive from lack of reliable hydrographic information: inadequate charts, little or no data on tides or currents, sparse soundings, absence of buoys, lights, etc. The prevalence of poor visibility, and mirage effects during good visibility restrict celestial observations. Considerable use is made of radar in navigating this area. 47613. ROBERTSON, R. GORDON. Radio in the Northwest Territories. A brief presented to the Royal Commission on Broadcasting. Need for improved broadcasting facilities in areas with no telephone, limited telegraph, and no daily newspapers is shown by the Territories' Commissioner. Existing facilities in a few communities are limited to 50-75 mi. range and are adequate in none. In large areas, broadcasts from the U.S.S.R. are among those most clearly received. Recommendations are made for a transmitter powerful enough to reach the Mackenzie valley-Great Slave Lake area from southern Canada, and for local stations to receive and re-broadcast transmissions; a Northern Broadcasting Service is advocated. Possible role of radio in educational services to whites and natives is discussed. Maps show relative quality and frequency of reception from Canada, U.S. A., and U. S. S. R., and distribution of population in Northwest Territories.

Förhandlingar, 1950. bd. 72, häfte 2, no. 461, p. 181–84, text map.) 6 refs. Text in Swedish. Summary in English. Title tr.: Studies concerning the melting away mountain region; a preliminary report.

Reports progress in determination of where the last Glacial ice melted away, citing analysis and interpretation of lateral and frontal form elements. Stream erosion and deposition on the free land surface to the south and east and ablation moraine and ice-dammed lakes near the ice border indicate the last ice to have been farther west than hitherto believed. Further work is necessary for definite conclusions.

47615. ROBIN, GORDON de Q. Determination of the thickness of ice shelves by seismic shooting methods. (Nature, London, Mar. 24, 1956. v. 177, no. 4508, p. 584–86, diagr., tables.) 4 refs.

Contains revised methods for evaluation of data from seismic shootings. The major inconsistency in earlier reports was the lack of agreement of ice thickness with the surface height of the ice shelves. The idea of an approximately constant equilibrium thickness of about 200 m. for ice shelves is incorrect. Data were from Second Byrd Antarctic Expedition 1934–35 and Norwegian-British-Swedish Antarctic Expedition 1948–1952.

Wiresonde temperature soundings were taken during two winters, 1952-53, 1953-54, at Eielson Air Force Base, near Fairbanks, Alaska, as part of an ice fog investigation. Correlations were found between the depths of the visible fog layers and the steep portions of the temperature inversions. The latter were usually confined to the lowest 100 ft. of the atmos-The frequency of occurrence of strong surface inversions was less than had previously been expected for an arctic continental area with temperatures in the vicinity of -40° C. This is attributed to the modifying effect of the ice fog, which was usually present in the observation area at temperatures below -30° C .--From author's abstract.

Copy seen: DGS.

47619. ROBINSON, FLORENCE M. Core tests and test wells, Oumalik area, Alaska. With: Paleontology of test wells and core tests in the Oumalik area, Alaska, by H. R. Bergquist. Washington, D. C., U. S. Govt. Print. Off., 1956. 70 p. 5 illus. on 2 plates, 5 text maps, diagr., fold. graph, 3 fold. logs, tables. (U. S. Geological Survey. Professional paper 305-A. Exploration of Naval Petroleum Reserve No. 4 and adjacent areas, northern Alaska, 1944-53. Pt. 5, Subsurface geology and engineering data.) 11 refs.

Five core holes, ten foundation tests, and two test wells (ranging from 47 to 11,872 ft.) were drilled during 1947-1951 in the Oumalik River region on the Oumalik anticline about 100 mi. southsoutheast of Point Barrow (at approx. 69°50' N. 155°15'-156°15' W.). From reports made to the U.S. Navy by various companies and the U.S. Geological Survey, structure of the area, purpose of the tests, and (in detail) the strata penetrated, logistics, engineering, and drilling operations are described. Lithologic descriptions are given in tables based on cores and cutting samples. Summaries of thermal investigations are given by Max C. Brewer. "The stratigraphic section penetrated consists of the Nanushuk group and the Topagoruk and Oumalik formations, of Early and Late Cretaceous age, plus a unit of Late Jurassic(?) and Early Cretaceous(?) ages. Shows of oil were negligible. Drilling of Oumalik test well 1 revealed some shows of highpressure and low-volume gas which is of little present commercial use."-From author's abstract. 47623. ROCH, ANDRÉ. Rapport sur le cours de glaciologie polaire organisé par SIPRE à Thule, en août 1956. Davos, Weissfluhjoch, [Oct. 30, 1956.] 17 l. incl. 7 diagrs. (4 fold.), map. 6 refs. Text in French. *Title tr.:* Report on the course of polar glaciology organized by SIPRE at Thule, in August 1956.

An instructional course and field trip organized by personnel of the U. S. Army's Snow, Ice and Permafrost Research Establishment, from Aug. 3–23, 1956 at Tuto (20 km. SE of Thule) are described. Several scientists from other countries were invited to participate. The field trip to the 160-mi. marker northeast of Tuto required 15 days. Several stops were made along the way, and practical demonstrations given of various glaciological methods and equipment. Results of earlier glaciological studies in this area are reviewed.

47624. ROCKIE, WILLIAM ALLAN, 1890—. Physical land conditions in the Matanuska valley, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1946. 32 p. 24 illus., 3 maps (1 fold.), 7 tables. (U. S. Soil Conservation Service. Physical land survey, no. 41.) 3 refs.

Results of a field survey of 317,510 acres, 1.5 percent cleared for crop production. Physical features, climate, and vegetation of the valley (61°29' N. 149°16' W.) are described, also history of settlement, past and present attempts at farming. More detailed descriptions, resulting from the survey, are given of topography, drainage, and soils, with discussion of suitability of the land for cultivation and other uses. tables on soil types, slopes, and erosion Only 18.7 percent amplify the text. (59,435 acres) of the total acreage is classed as tillable. About three-fifths (156,257 acres) of the remainder might be used for pasture or hay, if hardy strains available; and auxiliary mountain pastures used in summer. Specialized activities such as cranberry production and fur farming have been started on non-agricultural land.

47625. RODAHL, KÅRE, 1917- . Emergency survival in the Arctic. (Jour-

nal of aviation medicine, Aug. 1956. v. 27, no. 4, p. 368–72.) 13 refs.

Deals with the Arctic Basin, its area, climate and seasons; survival possibilities and adjustment to environment; individual and racial differences in response and adjustment to cold; physical fitness and chances of survival; indoctrination and equipment and their role in survival.

Copy seen: DNLM.

47626. RODAHL, KÅRE, 1917— . Eskimo metabolism; a study of racial factors in basal metabolism. Oslo, Brøgger, 1954. 83 p., illus., tables, maps. (Norsk polarinstitutt. Skrifter, no. 99.) 50 refs.

Investigation was carried out in 1950-52 at the Arctic Aeromedical Laboratory, Alaska, with the aid of the Norsk Polarinstitutt: 340 basal-metabolism tests were performed on 73 Eskimos from four different localities. About half of this study is devoted to description of the settlements (Barter Island, Anaktuvuk Pass, Kotzebue, and Gambell on St. Lawrence Island), their location and climate; and to the inhabitants, their occupation and diet. This is followed by reports including medical examination, body surface area measurements, food consumption, and urinary N elimination. The basal metabolism of the Eskimos living on their own diet and examined for the first time was found significantly higher than in Whites. However, about 9 percent of this higher metabolism is attributed to apprehension and about 15 percent to the Eskimos' high-protein Hence it is concluded that no diet. racial difference exists between Eskimos and Whites in basal heat production. 47632. RØNNING, OLAF I. Insektetende planter. (Ottar, Tromsø, Oct. 1956. nr. 8, p. 14–16, diagr.) Text in Norwegian. *Title tr.:* Insect-eating plants.

North Norway plants commonly known as sundew, butterwort, and bladderwort are discussed. Their appearance and means of capturing and consuming insects are described.

\*Copy seen: DLC.\*

47633. RØNNING, OLAF I. Kalkalger eller rugl. (Ottar, Tromsø, Dec. 1955. nr. 7, p. 19–22, illus.) Text in Norwegian. *Title tr.:* Lime algae or trouble.

Many kinds of lime algae grow along the coast of northern Norway. Much of the lime deposit on strandlines, used for street surfaces, originates on shallow bottoms where the algae thrive. Fishermen, whose nets are badly torn by the fresh algal incrustations on the bottom, call them "rugl", an old Norse word meaning trouble.

Copy seen: DLC.

47634. RØNNING, OLAF I. Marekvist eller heksekost. (Ottar, Tromsø, Oct. 1956. nr. 8, p. 22–24, illus.) Text in Norwegian. *Title tr.*: The witch's broom or witcheraft brush.

Parasitic fungus on trees develop brushlike clumps. Old-time beliefs about them are discussed. Such clumps are largely on birch in northern Norway.

Copy seen: DLC

47635. RØNNING, OLAF I. Moser på møkk og kadaver. (Ottar, Tromsø, Feb. 1955. nr. 3, p. 15–16, illus.) Text in Norwegian. Title tr.: Moss on muck and cadaver.

In northern Norway are three known

mosses restricted to mammal dung and three others restricted to decaying flesh. Their umbrella-like spore cases, the odor which attracts insects, and the transfer of spores by insects to other suitable growth sites are discussed. *Copy seen:* DLC.

47636. RØNNING, OLAF I. Nøtter. (Ottar, Tromsø, Mar. 1955. nr. 4, p. 29–30.) Text in Norwegian. Title tr.: Nuts.

Includes reference to hazelnuts growing in Norway as far north as Steigen, Nordland. Copy seen: DLC.

47637. RØNNING, OLAF I. Nye funn av Carex holostoma. (Blyttia, 1956. Bd. 14, hefte 3, p. 100-102, text map.) 5 refs. Text in Norwegian. Summary in English. Title tr.: New localities of Carex holostoma.

This sedge was collected on the border between the Karasjok and Polmak districts in arctic Norway. This is nearly midway between the species' western area of distribution in Troms and western Finnmark, and the eastern area of distribution in Sørvaranger and Petsamo areas.

\*\*Copy seen: DA.\*\*

47638. RØNNING, OLAF I. Om saa kaldede løsnings-stene eller vettenyrer. (Ottar, Tromsø, Feb. 1955. nr. 3, p. 8-9, illus.) Text in Norwegian. *Title tr.:* On the so-called relaxation stone or kidney-spirit.

The seeds of two West Indian plants carried by the Gulf Stream are often found on the north Norwegian coast and farther east (13 specimens are in Tromsø Museum). The larger seed cases (Entada gigalobium) approx. 5 cm. in cross-section, have been used as snuffboxes. Some of the smaller seeds (unidentified) have been successfully sprouted.

Balloonsonde operations using the Dines meteorograph in northern Sweden (approx. 68.5° N. 19° E.) are discussed. The meteorograph is described, and results of the upper air measurements are tabulated and compared with data obtained in 1907–1909. An analysis is given of the distribution of the recovery points of the instruments after launching, and the recovery points are mapped. The vertical temperature distribution is charted for approx. 65 balloon runs. Only a brief analysis of the upper air data is given. \*\*Copy seen: DWB.

ROLFE, E. J., see Hollingsworth, D. F., and others. The use of dehydrated foods . . . 1956. No. 45588.

47647. ROLLINS, REED CLARK, 1911. A monographic study of Arabis in western North America. (Rhodora, July-Sept. 1941. v. 43, no. 511-513, p. 289-325, 348-411, 425-81, 9 illus., 25 text maps.)

The genus and its relationships are discussed and artificial keys given; 53 species and many varieties are described, six species and ten varieties as new, and several new combinations established. At least six varieties are native to Alaska, the Aleutians and northern Canada; A. lyrata var. kamtschatica is recorded in Kamchatka Peninsula.

Copy seen: DA.

47648. ROLLINS, REED CLARK, 1911- . Smelowskia and Polyctenium. (Rhodora, Aug. 1938. v. 40, no. 476, p. 294-305, plate 496.) Issued also as: Contrib. from Gray Herbarium of Harvard University, no. 122.

A taxonomic and micro-technical study of these two cruciferous genera: synopses are given; and two species and four varieties of Smelowskia are described, also one species and two varieties of Polyctenium. S. calycina var. integrifolia n. comb. native to Alaska (Port Clarence, Nome) and eastern Siberia (Plover Bay) is included.

Copy seen: DA.

47649. ROLLINS, REED CLARK, 1911- . Studies in the genus *Hedysarum* in North America. (Rhodora, July 1940. v. 42, no. 499, p. 217-39, plate 597.) Pub. also as Contrib. from the Gray Herbarium of Harvard University, no. 131.

Discussion and synopsis of the genus are followed by descriptions of six species (one new) and six varieties (two new) of H. alpinum var. americanum (Newfoundland and "probably Alaska"), H. a. var. grandiflorum n. var. (Labrador) and H. mackenzii (northern Manitoba, Northwest Territories and Yukon Territory) are included.

47655. ROOTS, ERNEST FREDERICK, 1923- . Canadian "Operation Franklin", 1955. (Polar record, May 1956. v. 8, no. 53, p. 157-60, 2 illus., text map.)

Describes Canadian Geological Survey's reconnaissance survey of the Queen Elizabeth Islands (except eastern Devon, eastern and northern Ellesmere, Prince Patrick, and western Melville; but including Prince of Wales, Somerset and northwest tip of Baffin). During Apr.-June, three parties, flown in by DC-3, set up main field bases and fuel caches and started mapping geology from each base. Main survey during June-Sept. comprised nine two-man parties transported by helicopters to selected stations and moved to new localities every few days. Geology was observed and investigated over Airborne geophysical 80,000 sq. mi. surveys supplemented the operation. Scientific and aircraft personnel (52) are listed. Copy seen: DLC.

47656. ROPPEL, ALTON Y. Peak hours of pink (Oncorhynchus gorbusha) and chum (O. keta) salmon fry migration from Old Tom Creek, S. E. Alaska, 1952. (Copeia, May 29, 1956 no. 2, p. 110-11, 2 illus.)

Contains notes on the investigation carried out in the course of a marine survival study conducted by the U. S. Fish and Wildlife Service on the east coast of Prince of Wales Island. The hourly catch of fry shown (fig. 2) is the summation of counts for 17 days, June 8-25. The migration peak was reached between midnight and 1:00 a. m., and apparently was unaffected by changes in light intensity resulting from moonlight or overcast.

47657. ROSE, DONALD CHARLES, 1901-, and J. KATZMAN. The geomagnetic latitude effect on the nucleon and meson component of cosmic rays at sea-level. (Canadian journal of physics, Jan. 1956. v. 34, no. 1, p. 1-19, diagr., charts, map.) 18 refs.

Contains data of measurements made on the changes in intensity of the nucleon and meson components of cosmic rays during the 1954 cruise of the Canadian ice-breaker Labrador into arctic waters, through the Northwest Passage, and circumnavigating the North American continent. Geomagnetic latitudes covered

extend from 18° N. to 89° N. The latitude knee is clearly shown at a latitude of about 52° for the nucleon component and less definitely between 40° and 50° for the meson component. The nucleon component shows a significant difference in intensity between measurements going north roughly along the geographic meridian containing the geomagnetic pole and going westward from there through the Northwest Passage and the Beaufort Sea. The diurnal variation of the nucleon component in arctic regions is small and irregular as would be expected during low solar activity. Copy seen: DLC.

47658. ROSE, DONALD CHARLES, 1901—, and others. Latitude effect of the cosmic ray nucleon and meson components at sea level from the Arctic to the Antarctic. (Canadian journal of physics, Sept. 1956, v. 34, no. 9, p. 968-84, diagrs., tables, text map.) 8 refs. Other authors: K. B. Fenton, J. Katzman, and J. A. Simpson.

Contains results of cosmic ray measurements made on board the ice-breakers HMCS Labrador during its circumnavigation of North America in 1954 and the USS Atka on its Antarctic expedition from Boston beginning in Dec. 1954. Fixed station monitors were in operation at Ottawa and at Climax, Colo. during the entire period of observations. The data clearly show that a simple eccentric dipole magnetic field does not adequately describe the outer magnetic field distribution with which the incoming cosmic ray particles interact. Copy seen: DLC.

47659. ROSE, DONALD CHARLES, 1901—, and A. G. VOISIN The low energy spectrum of cosmic-ray mesons at sea level at high geomagnetic latitudes. (Canadian journal of physics, Sept. 1952. v. 30, no. 5, p. 373–87, diagrs, graphs.) 17 refs.

A description is given of three methods employed to measure the differential range spectrum of cosmic-ray mesons at Ottawa and Resolute. General results obtained by the methods were similar and no significant differences between the two latitudes were noted. *Copy seen:* DLC.

47660. ROSE, DONALD CHARLES, 1901—. Meteorological effects on cosmic ray intensity and the meson spectrum. (Canadian journal of physics, Mar. 1951. v. 29, no. 2, p. 97–110, diagrs., table.) 18 refs.

New calculations of the "barometer" and "temperature" effects on cosmic ray intensity are presented, and results compared with measurements obtained for one year at Ottawa and Resolute (74°41' N. 94°55' W., geomagnetic lat. 83° N.). Calculations of the temperature effect do not yield results comparable with measurement, although they indicate general agreement with the expected behavior. Calculations of the barometer effect are more comparable with measurements and indicate that consideration information can be obtained about the meson spectrum from measurements of the barometer coefficients. Copy seen: DLC.

47661. ROSE, DONALD CHARLES, 1901- , and J. KATZMAN. The sudden increase in cosmic ray intensity of February 23, 1956. (Canadian journal of physics, Aug. 1956. v. 34, no. 8, p.

884-87, diagrs.) 2 refs.

47662. ROSEBERRY, CECIL R. Men against the icecap. (Saturday evening post, Apr. 7, 1956. v. 228, no. 41,

p. 38-39+, 6 col. illus., map.)

Popular account of conditions on the Greenland inland ice and of various studies carried out in the area during and after World War II. Particular attention is given to Operation Southwind, a heavy cargo-hauling mission in Oct. 1955 under Col. Page H. Slaughter, and the first attempt at continuous movement over the icecap during winter blackout. Problems of crevasse detection and bridging, navigation, and trail-marking were encountered. Freight was delivered at the inland ice location 700 miles from Thule in two months. Copy seen: DLC.

47663. ROSÉN, P. G. Total solförmörkelse i Lappland sommaren 1896. (Svenska turistföreningen, Stockholm. Arsskrift, 1896. p. 218-26, fold. map.) Text in Swedish. Title tr.: The total solar eclipse in Lapland in the summer of

Announcement of the eclipse to occur in Aug. 1896, with the area of totality, to cross over Kebnekaise, Torneträsk, and Vadsø, mapped. Time and duration of the eclipse are noted, as are convenient routes and interesting sites for its observations, and the altitudes of high mountain peaks in the area. Copy seen: DGS.

47664. ROSENDAHL, CARL OTTO, . Studies in Chrysosplenium with special reference to the taxonomic status and distribution of C. iowense. (Rhodora, Feb. 1947. v. 49, no. 578, p. 25-36, plates 1053-54.) Pub. also as: Contrib. from the Herbarium of the University of

Minnesota, no. 3.

Contains a comparative critical study of two closely related species, C. iowense and C. tetrandrum, with a key, description, critical notes and a list of specimens. The first species is native to Victoria Island and the shore of Cairn Lake on Baffin Island; the second is reported from Swedish Lapland (67°30' N.). Two collections of Chrysosplenium from Vaygach Island and the mouth of Yenisey River, identified by Russian botanists as alternifolium, are probably "low arctic forms of C. iowense."

Only one species of the pectinid (bivalve mollusc) genus Velata has been found in the Lias of East Greenland. A systematic description of Velata hartzi n. sp. is given, based on material collected by the writer in eastern Jameson Land (70°40'-71° N. 20°-24°30' W.) in 1926-1929, and 1934. A fragment of a left valve of this species was also found among material collected by N. Hartz at Kap Stewart in 1892 during the Danish expedition to East Greenland led by C. Ryder. The species is rare in the Liassic beds of Scoresby Sund region and has been found only in eastern Jameson Land. Copy seen: DGS.

47671. ROSENKRANTZ, ALFRED, 1898- . Paul Egedes forfærdelige havdyr. (Grønland, Sept. 1956, nr. 9, p. 334-40, illus.) Text in Danish. *Title tr.:* Paul Egede's horrible sea animal.

Contains quotations from Paul and Hans Egede's descriptions of a large sea animal seen outside Godthåb (64°11' N. 51°43' W., West Greenland) in 1734 by the former. Suggestion is made that it must have been a species of baleen whale. A description is given of author's experience in 1948 with lesser rorqual, Balaenoptera rostrata.

47672. ROSENTHAL, STANLEY L, and W. A. BAUM. Diurnal variation of surface pressure over the North Atlantic Ocean. (U. S. Weather Bureau. Monthly weather review, Nov. 1956. v. 84, no. 11, p. 379–87, 2 text charts, 12 tables.) 16 refs.

Data from ocean weather ships in the area 35°-66° N. 2° E.-69.6° W. for the approx. period 1948–1955 were used to determine for each month: the daily variations of mean surface pressure; the three-hour mean-pressure tendencies; and the phases and amplitudes of the first three harmonics of the daily variations. Data are given in tables and some implications of the results are discussed.

Copy seen: DGS.

47673. ROSING, JENS. Renjakt i det gamle Grønland. (Polarboken, 1956. p. 99-112, illus.) Text in Danish. *Title tr.:* Reindeer hunting in the old Greenland.

Reindeer hunting was always the preferred occupation of Greenland Eskimos. Earlier hunting sites include Narsarsuk in Upernavik, Núgssuak, Disko Bugt, Ataneq and Qavdlunaitsait near Godthåbsfjord, and Igaliko in West Greenland, also Kap Dan and Talut in East Greenland. Weapons, hunting methods and campsites are described. Take from hunts over the years is summarized: more than 460,000 head of deer were killed in the period 1838–1855 as compared to less than 120,000 in 1863–1893. Illus. by drawings of hunting techniques, weapons, etc. Copy seen: DLC.

47682. ROUKHITAINEN, M. I. Nekotorye zakonomernosti vesennego razvitifa fitoplanktona Vostochnogo Murmana, (Akademifa nauk SSSR. Doklady, July 11, 1956. t. 109, no. 1, p. 209-211, 4 illus.) Text in Russian. Title tr.: 11 refs. Some regularities in the vernal development of phytoplankton from the eastern Murman.

Deals with phytoplankton of the littoral zone of Barents Sea from Kildin Island to Cape Svyatoy Nos (20 miles). average number of plankton cells (0-25 m.) in March was 20,000/cu. m.; two collections, Apr. 12-15 and Apr. 23-27 at depth 0-50 m. were 995,500 and 18,400,000 specimens respectively in a cu. m. Fifteen species of Algae were registered in March, and 26 plankton species in April. The optimal conditions for plankton development exist in the eastern, shallow section of the Murman coast waters: coastal cold-water species begin to develop in March or April and they are followed by deep-water species. Copy seen: DLC.

47683. ROUNDEL. Inspection at Forbisher. (Roundel, June 1956. v. 8, no. 5,

p. 20, illus.)

Notes inspection by the Canadian Minister of National Defence (Mr. Campney) and U.S. Secretary of Defense (Mr. C. E. Wilson) of a group of Canadian Rangers at Frobisher Bay, Baffin Island. The Canadian Rangers are unpaid volunteers constituting a component of the Army's Reserve Militia; they are recruited from among the local inhabitants, and carry on coast watching, searches for crashed aircraft, etc. Copy seen: DLC.

47684. ROUNDEL. They took to the woods; cold-weather test at Cold Lake. (Roundel, Apr. 1956: v. 8, no. 3, p. 11-15,

Survival test conducted during a tenday winter period near a lake 25 mi. northwest of Cold Lake, Alta., by nine air crew (a six-man group and three solo) with three observers of the Royal Canadian Air Force, is described. Journal of a solo testee is included. No extreme discomfort was recorded by any of the men, although they lost an average of 11 lb. Such tests have limited application since those testing the various equipment and supplies are uninjured and free of psychological stress. *Copy seen:* DLC.

"Some criticism is raised to the theoretical treatment by Jumikis (in No. 35507) of the suction force associated with the formation of ice lenses in soil, but general agreement is indicated on the physical concepts involved. Soils may, under the proper conditions, show ice segregation in spite of favorable theoretical qualities; but experience has shown that well-graded aggregates containing more than 3 percent of particles finer than 0.02 mm. do not cause frost damage to roads, even though subsoil and climatic conditions favor ice-lens formation. A

sample calculation of suction values is included, based on several simplifying assumptions."—SIPRE.

The phenomenon, which lasted only a few seconds, was observed on July 14, 1953 by members of the Oxford University Expedition to West Spitsbergen, near the foot of the Von Postbreen, Tempelfjorden, 78°20' N. 17° E. It occurred at a point where a small melt stream crossed a closed crack in the ice, developing a glacier mill at the crossing. spout repeated 6 times at exactly 10-min. intervals, probably a result of the intermittent generation of hydrostatic pressure within the glacier. The regularity of the spout suggests a syphon system as a possible cause. References to similar phenomena are given in an editorial note.—From SIPRE.

47698. RUDBERG, STEN. Kursudalar i Norrbotten. (Geologiska föreningen, Stockholm. Förhandlingar, 1949. bd. 71, häfte 3, no. 458, p. 442–94. 8 illus., 1 diagr., 3 text maps.) 82 refs. Text in Swedish. Summary in English. Title tr.: "Kursu" valleys in Norrbotten.

The kursu (local name) is a valley which commonly has an upper, wider section in Quaternary deposits and lower, canyon-shaped section cut in bedrock. It is often disconnected by a series of intervening plunge pools, and is believed to be superposed. Neither fluvial nor glacial erosion appears to account for its origin which must be due to erosive action of water controlled by the ice during the melting process of the ice sheet in north-Scandinavia. Muddus valley Muddus National Park is one of the most picturesque of these valleys in Swedish Lapland. Copy seen: DGS.

47702. RUMANTSEV, NIKOLAI MI-KHAILOVICH. Pobeda sovetskoi armii v Zapoliar'e; desiatyi udar, 1944 god. Moskva, Voennoe izd-vo, 1955. 104 p. illus., ports., maps. Text in Russian. Title tr.: Victory of the Soviet army in the polar region; the tenth thrust, 1944.

Account of military operations in Kola Peninsula during World War II. The so-

called defensive operations of the Soviet Army and Navy in 1941 which succeeded in halting the German and Finnish onslaught are reported. The situation on the northern front in 1942-43 and its role in the war are outlined. Nine Soviet operations or "thrusts" on other fronts in 1944 are noted; the tenth, took place on the northern front, Oct. 7-25, and ended with Russian occupation of Petsamo (now Pechenga) and of the German stronghold at Kirkenes, northern Norway. operation is described in detail: deployment of German forces, their defenses, day-by-day development of the battle, with illus. and plans. Episodes showing valor of Soviet combatants and workers are reported. Natural resources of the Kola Peninsula and its industrial development in the Soviet period are stressed. Defense of the Russian North from attacks by the Vikings. Norwegians, Swedes, and in the Allied intervention are briefly outlined in introductory chapters.

Reviewed favorably by K. Belokonov in Voennyl vestnik, Jan. 1956, god 36.

47703. RUNCORN, STANLEY KEITH, 1922- Palaeomagnetic comparisons between Europe and North America. (Geological Association of Canada. Proceedings, Nov. 1956. v. 8, pt. 1, p. 77–85, 2 text charts, diagr., graph, 2 tables.) 9 refs.

"Pole positions derived from the remanent directions of magnetization from American sediments of various geological ages are in rough agreement with those derived from British rocks of the same age. Consequently there is now strong evidence of polar wandering." Comparisons between North America and Europe are considered with discussion of existing discrepancies and errors in the paleomagnetic direction. It is tentatively concluded that North America was displaced westwards relative to Europe by almost 24° in the post-Triassic, probably late Mesozoic.

Describes author's expedition to Finmark with Olaf Rønning, curator of Tromsø Museum, to find a rare (glabrous) variety of catfoot or cudweed. From Tromsø they traveled via Lakselv at the bottom of Porsanger Fjord, and Karasjok (approx. 69°30′ N. 25°30′ E.) along the Tana River on the Finnish frontier to Levajok (approx. 69°50′ N. 26°20′ E.). On the mountain Suoidnegaissa, about 30 km. west of Levajok, specimens of the plant were found.

Contains taxonomic remarks on this species, distributional notes, and ecology; the hybrid V. tenella x serpyllifolia (Lule Lappmark), is described, disjunct distribution in Fennoscandia discussed and a list of localities given, including Nordland and Tromsø (Norway), Swedish Lapland, Kuusamo and Tuloma Lapland (Kola Peninsula). Copy seen: DLC.

47708. RUNEMARK, HANS. Studies in Rhizocarpon I, taxonomy of the yellow species in Europe; II, distribution and ecology of the yellow species in Europe. Stockholm, Almqvist & Wiksell, 1956. 2 pt.: 152 p. 39 illus., 7 tables; 150 p., 47 maps. (Opera botanica a Societate botanica lundensi; in supplementum

seriei "Botaniska notiser," v. 2, no. 1–2) 187 + 35 refs.

In pt. I, a general account of this lichen genus is given: its anatomy, morphology, aromatic substances and their identification, ecology and distribution of the yellow species (containing rhizocarpic acid). A taxonomic account follows (p. 46–136) with discussion of the genus, keys and descriptions of 29 species, synonyms, Latin diagnoses of the eight new species. Illustrations, taxonomic remarks, variability, also data on lichen substances, ecology, and distribution are given for each species.

Pt. II is devoted to the distribution, habitat and ecology of the species in Europe; the influence of edaphic, climatic and competitive factors is discussed. The yellow R. species are saxicolous and mainly bound to siliceous rocks in dry localities exposed to sunlight; many species are very weak in competition. Total and European distribution of R. are tabulated, with respectively, 14 and 13 species in the Arctic. For each species, the distribution and ecology are considered (maps), localities listed by country.

47709. RUONG, ISRAEL, 1903—. Fjällapparna i Jukkasjärvi socken. Uppsala, Appelberg, 1937. 76 p. 8 diagrs., 14 illus., 6 maps incl. 1 fold, 5 tables. (Geographica, no. 3.) 76 refs. Text in Swedish. Summary in German. *Title tr.:* Mountain Lapps in Jukkasjärvi parish.

The life of reindeer Lapps in Sweden's northernmost parish is considered from the 16th century, as it has been affected by the topography, geology, vegetation, and climate. The influence is discussed of the increased sedentary population, of modern communications, of the penetration of a money economy, and of tourism. Swedish, Norwegian, and Russian governmental decisions have protected Lapp rights in modified forms that restrict their privileges but on the whole ensure continuation of their way of life. Effects of these changes on size and make-up of herds and on methods of supervision are traced and explained. Only on the Kola Peninsula and in the Petsamo region has the earlier form of nomadism continued wherein a few domesticated reindeer are owned and hunting of wild reindeer is still practiced. The modern trend in family life is for most of the family members to remain throughout the summer at

the customary spring and fall campsites, where firewood and fish are available. Only those actively engaged in supervision of herds go to the uplands. Dwellings have been modified as a result, and more substantial quarters, often of sawn lumber, are erected at these main sites. Summer housing on the uplands may be portable or permanent. Typical Lappish structures are illustrated and described. Lapp terminology is interpreted.

Copy seen: DGS.

47710. RUONG, ISRAEL, 1903—. Nomadskolorna i Sverige. (Sameliv. Samisk selskaps årbok 1951—1952. p. 14–27, illus.) Text in Swedish. *Title tr.*: Nomad schools in Sweden.

Education was started among Swedish Lapps in the 17th century by missionaries; its subsequent organization is reviewed and an account given of the present-day system. During some periods the emphasis has been on ambulating schools, during others on stationary schools, the latter at present. Ten stationary boarding-schools are in operation with some 400 pupils who attend for about 35 weeks annually during six or seven years. The syllabus is similar to that of other elementary schools but with teaching of reindeer husbandry and matters connected with Lapp civilization.

42, p. 55-57.)

In Sept. 1955, the Muskeg Tractor Model M5 (Bombardier Snowmobile Ltd.) and the North King Universal Transporter were tested for work in the northern Manitoba muskeg region extending from Gilliam on the Hudson Bay Railway (56°21' N. 94°43' W.) east to Hudson Bay. The first machine proved superior; it is a low-slung, wide-based tractor with extra-wide tracks giving ground pressure of 3/4 lb./sq. in. Payload is one ton for the tractor and one and onehalf tons for the trailer. The region is described, also process of choosing a route, provision of corduroy support, winter travel. Copy seen: DGS.

47713. RUSSELL, GEORGE A. A geological reconnaissance of the Wolverine and Caribou Rivers, Cross Lake mining division, northern Manitoba. Winnipeg, Queen's Printer, 1953. 10 p. fold. map 48 x 28 in., table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 52–2.) 2 refs.

Map (scale 1 in.: 4 mi.) covers area immediately bordering the two rivers, 59°-60° N. 94°-99° W., along the west coast of Hudson Bay. Wolverine River is a tributary of Seal River. Physical geography is described. Bedrock outcrops are rare due to glacial drift cover. Consolidated rocks are Precambrian, the oldest being metamorphosed sediments. few areas of rocks varying from diorite to amphibolite occur. Most of the region is underlain by a granitic complex. Pleistocene glacial deposits are briefly discussed; also structure. Ore minerals were seen, but nowhere in abundance. Scarcity of bedrock outcrops would make prospecting expensive. Copy seen: DGS.

47714. RUSSELL, ISRAEL COOK, 1852-1906. Glaciers of North America; a reading lesson for students of geography and geology. Boston, Ginn & Co., 1897.

210 p. illus., text maps, diagrs.

Includes (p. 74-145) description of glaciers of Alaska and northwest Greenland - Ellesmere Island. Alaska glaciers include Taku, Muir, Turner, Hubbard, Nunatak, Seward; glaciers of Lynn Canal, interior Alaska, Alaska Peninsula, and Aleutian Islands (briefly); Malaspina Glacier (in detail); ground ice is described.

Glaciers of Grinnell Land, Ellesmere, and of northwest Greenland are briefly discussed on the basis of expeditionary reports. Other chapters deal with general characteristics of glaciers, relation of climate and local factors to glacial behavior, theories of glacier mechanics, and the life cycle of a typical glacier.

1956. No. 1540, p. 109-110.)
Abstract of lecture delivered to the Society May 16, 1956. Area lies in the Caledonian orogenic belt, west of the main thrust zone (66°55′ N. 14°15′ E). General structure is that of a synform, on a N-S axis, with steep eastern and gentle western limb. The two main rock groups are a central gneissic group surrounded by a metasedimentary group. Origin of these rocks and structure of the area are discussed. Two main periods of folding occurred, both during the Caledonian orogeny.

47716. RUTLEDGE, F. A., and others. Preliminary report: nonmetallic deposits accessible to the Alaska Railroad as possible sources of raw materials for the construction industry. Washington, D. C., Mar. 1953. 129 p. illus., diagrs., sections, 52 tables. (U. S. Bureau of Mines. Report of investigations 4932.) 48 refs. Other authors: R. L. Thorne, W. H. Kerns, and J. J. Mulligan.

Probable markets (military, governmental, civilian) for construction materials in the Alaskan Railroad belt are considered as a prerequisite for any

development program for a building materials industry. Accessibility, physical features, climate, history and production, and general geology of the region are briefly described. Then follows discussion of the types of building materials: brick and clay products, lightweight aggregate, pozzolan, mineral wood, cement, aggregates. Properties and uses of each are noted; also location and description of, and tests made on, the nonmetallic deposits investigated under each of these categories.

Contains results of a study of white hare infection by nematodes of the genus Protostrongylus carried out in Yakutia, summer 1955. These parasites develop in the respiratory system of the hare and their larvae are dispelled with excrement. Two species of terrestrial molluses, Vallonia tenuilabris, and Pupilla muscorum, which are eaten by the hares were found to be infected by larvae of Protostongylus kamenskyi and P. terminalis. Hence they serve as intermediary hosts in the local biological cycle of this parasite.

47740. SABLE, EDWARD G. New and redefined Cretaceous formations in western part of northern Alaska. (American Association of Petroleum Geologists. Bulletin, Nov. 1956. v. 40, no. 11, p. 2635-43, 2 text maps.) 7 refs.

The Nanushuk group is redefined in the Utukok-Corwin area (approx. 68°45′-70° N. 160°-165°30′ W.) including basins of Kokolik, Kukpowruk and Pitmegea Rivers, where the group consists of two formations, the Kukpowruk (new), and

the Corwin (redefined). The dominantly marine Kukpowruk formation consists largely of shale, siltstone, and sandstone; it overlies and intertongues with the upper part of the Torok formation. The Corwin formation is dominantly nonmarine, and consists largely of shale. siltstone, sandstone, conglomerate, and coal; it overlies and intertongues with the upper part of the Kukpowruk formation, and is overlain by the Prince Creek formation of the Colville group. Nomenclature of the Nanushuk group in the Colville River region in the eastern part of northern Alaska is discussed by G. Gryc and others, q. v.

47745. SAETERSDAL, GUNNAR SEL-MER, 1922— . Haddock, Arcto-Norwegian stock; age distribution and migration. (International Council for the Exploration of the Sea. Annales biologiques, 1954, pub. 1956. v. 11, p. 97–100, illus., tables, maps.)

Account of investigations conducted since 1950 on the Finmark coast and down to the Lofoten. Age analyses, year-class distribution and their effect on the yield are discussed. Returns from tagging activities indicate that the haddock of the Barents Sea and Svalbard areas constitute one population, the mature fish among it migrating to spawn on the Norwegian coast each spring.

Copy seen: DI.

47746. SAETERSDAL, GUNNAR SEL-MER, 1922— . The haddock in Norwegian waters 1; vertebrae counts and brood strength variations of young fish. Bergen, J. Grieg, 1952. 14 p. tables, map. (Norway. Fiskeridirektoratet. Skrifter, ser. Havundersøkelser, v. 10, no. 4.) 6 refs.

Report on some investigations on young fish from northern Norway and the Barents Sea. Age groups 0-II are analyzed with respect to number of vertebrae; brood strength and growth. Distribution of eggs and larvae over the area is also studied. It is concluded from the uniformity of data that "these areas are inhabited by one main population."

47748. SAETERSDAL, GUNNAR SEL-MER, 1922- . Temperaturen og saltholdigheten som faktorer av betydning for plante- og dyrelivet i sjøen. (Naturen, 1953. Årg. 77, nr. 6, p. 178-90. 3 illus., text-map.) Text in Norwegian. Title tr.: Temperature and salt content as factors of significance for plant and animal life in the sea.

Temperature and salinity of sea waters are probably the main variable environmental factors for most marine animals, warm- or cold-blooded, variable or invariable in their body-salt content. All have tolerance regions with maximum and minimum values of heat and salt, with probably even more restricted reproductive regions. Ranging habits and spawning grounds of cod and herring off the Murmansk and Norwegian coast are related to water temperature which affects both sexual development and feeding requirements. Even the arctic whale, a warm-blooded creature, goes to more temperate regions at calving time, presumably to spare the young the great change of temperature from the mother's body to polar water.

47749. SAETHERSKAR, JOHANNES, Editor. Det norske naeringsliv; Finnmark fylkesleksikon. Bergen, Norske naeringsliv forlag, 1952. 697 p., illus., diagrs. ports., maps. Text in Norwegian. Title tr.: Norway's livelihood: Finn-

mark provincial lexicon.

Thirteenth in "Det norske naeringsliv" series of systematic regional reports on business life, institutions of various kinds including schools, occupational development, and future prospects. In part 1, the general survey (by Erling Bjørgan) of the topography, economy, and history of Finnmark, Norway's northernmost province, is followed by 30 short articles. They deal with fishing, mining, forestry, agriculture and animal husbandry, hydro-electric power, travel conditions and routes, trade, cooperative activities, homecrafts and large and small industries, homemaking, homesteading, health, art, architecture, museums, occupational organizations and unions, bequest funds available for charities and education, educational requirements of various trades and professions, institutions, and opportunities.

In pt. 2 (p. 225–416 and 593–632) are descriptions of individual towns and communes with appropriate subdivisions on various activities, culture, and planning. Pt. 3 (p. 417–589 and 633–70) provides, by community, short accounts of all business firms and individuals, and an index by occupations is appended, in which Hammerfest and Vardø are listed separately and all other communities combined into a general register.

Many alkali amphiboles fail to show complete extinction on (010) between crossed nichols, even in monochromatic light. On (100), striations parallel with the trace of the c-axis were noted. Chemical and optical analyses were made on a specimen of arfvedsonite from Kangerdluarssuk, West Greenland (61° 05' N. 46°05'-10' W.). The optical anomalies are apparently caused by some kind of mosaic structure. X-ray data indicate that the specimen represents a perthitic intergrowth of two amphibole components with slightly differing unit cell dimensions. When fragments of the crystal were heated, the optical anomalies disappeared. The crystal had become homogeneous. "It is concluded that an amphibole of the arfvedsonite composition is not stable at low temperatures but will become unmixed."

47753. ŠAHOVIĆ, K., and others. Iskoristljivost glikoze u pojedinim organima na različitim stepenima hipotermije. (Srpska akademija nauka, Belgrad. Glas, 1956. v. 217, odeljenje medicinskih nauka, no. 10, p. 29–50, illus., tables.) 22 refs. Text in Serbo-Croatian. Summary in French. Other authors: A. Bata and P. Milutinović. Title tr: Utilization of glucose by various organs of the hypothermic animal.

Account of studies on dogs made hypothermic down to 18° C. The level of glycemia was found to be dependent on the degree and duration of cooling; the difference in glycemia between the arterial and venous femoral blood increased with the degree of hypothermia as a result of tissue hypoxia; glycogenolysis of the liver was most intense at temperatures of 26°-23° C. Finally, kidney utilization of glucose was conditioned by variation in urine secretion and by glycosuria. Copy seen: DNLM.

47754. SAILER, REECE IVAN, 1915—, and others. Notes on Culicoides in Alaska; Diptera, Heleidae. (Mosquito news, Dec. 1956. v. 16, no. 4, p. 270–78, illus.) 8 refs. Other authors: E. P. Marks and S. E. Lienk.

Contains notes on Alaskan punkies, based largely on observations of the Alaskan Insect Control Project during 1948, and those of the senior author in 1951 and 1953. The insects were studied at Anchorage, Valdez, Fairbanks and along the Alaskan Highway system. Observations include area prevalence, flight habits, landing counts, prevalence according to ecological criteria, annoyance and bites, larval habitats, species known from Alaska.

Copy seen: DNLM.

47755. SAINSBURY, CLEO L., 1921 - . Wind-induced stone tracks, Prince of Wales Island, Alaska. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 1, p. 1659-60, 3 illus.) 2 refs.

Describes tracks observed in summer 1955 in the littoral zone of the delta of Thorne River (55°40′ N. 133° W.) They are formed in water not more than six in. deep by stones dragged by attached wind-blown kelp. All tracks seen were formed on gentle seaward-facing slopes at ebb tide during strong off-shore winds. Individual grooves may be as much as one in. deep and several in. wide. In this environment they may be buried by river sediments during high water and thus preserved.

47756. SAKAI, AKIRA. The effect of temperature on the hardening of plants. (Teion kagaku, Low temperature science, Sapporo, 1956. v. 14, ser. B, p. 7-15, illus. tables.) 6 refs. Text in Japanese. Summary in English.

Effective temperatures for hardening cut-off mulberry twigs were found to lie below 10° C. Effectiveness of hardening increases with decreasing temperature when length of exposure is fixed; it also increases with increase of exposure time at a given constant temperature. Intermittent exposure for 16 hours at 0° C. and eight hours at 15° C. for 20 days showed no better hardening than continuous exposure to 0° C.

\*\*Copy seen: DLC.\*\*

47757. SAKAI, AKIRA. The effect of temperature on the maintenance of the frost hardiness. (Teion kagaku, Low temperature science, Sapporo, 1956. v. 14, Ser. B. p. 1-6, illus., tables.) 5 refs. Text in Japanese. Summary in English.

As frost hardiness is increased by artificial or natural means, the time during which parenchyma cells of twig cortex can withstand continuous freezing, becomes longer. At a continuous temperature of  $-10^{\circ}$  C., the twigs of mulberry trees and poplars survived 30 and 80 days respectively. Twigs withstood freezing longest at a temperature of  $-5^{\circ}$  C. hence storage at that temperature is most effective. **Copy seen:** DLC.

47758. SAKAI, AKIRA. Survival of plant tissue at super-low temperatures. (Teion kagaku, Low temperature science,

Sapporo, 1956. v. 14, ser. B. p. 17-24, illus. tables.) 9 refs. Text in Japa-

nese. Summary in English.

Contains a study on the effects of dehydration of willow, poplar and mulberry twigs upon their resistance to very low temperatures. Dehydration was obtained by freezing at -10 to -30° C. and the very low temperature test by immersion in liquid N<sub>2</sub> for 10 minutes. Prefreezing at -30° gave a survival of parenchyma cells of 80-90 percent and exposure to very low temperature could be substantially extended. Pre-freezing at -10° or its omission produced no survival of parenchyma.

47759. SAL'E, E. A. Metody geofizicheskoI razvedki na lovchorrit. (In: Khibinskie apatity, 1933. t. 6, p. 133– 35.) Text in Russian. Title tr.: Methods of geophysical prospecting for lovchorrite.

A special radiometric method is described for locating lovehorrite deposits in the Yukspor. It is based on emission of a small amount of thorium and uranium in the lovehorrite ores. Method of alpha and gamma radiation was found unsatisfactory due to the high humidity locally. A method with ionization chamber and chloro-calcium dehumidifier was found satisfactory except for some anomalies caused by sphene and loparite deposits containing uranium. Additional measurements are required in this identification.

47767. SALOMONSEN, FINN, 1909—. The Greenland bird-banding system. (Arctic, 1956. v. 9, no. 4, p. 258–64, illus, text map, table.) 8 refs.

Describes program of Ministeriet for Grønland and Universitetets Zoologiske Museum, København, initiated in 1946, with note of earlier banding by Dr. Bertelsen (reported in No. 1475). Settlement and outpost managers (approx. 80) organize local banding on standard instructions in Eskimo and Danish (illus.) and forward records at end of season to the Museum. A total of 30,215 birds were ringed during 1946-1954, and 2,474 recovered, mostly shot and mostly (2,291) in Greenland. Data are tabulated for species (39), also recovery percentages for the more common forms. Migration routes disclosed are briefly discussed. An arctic tern, banded in Disko and recovered in Natal 18,000 km. distant in less than three months, is signalized as the longest flight recorded by banding. Addendum offers further recovery data (abroad) and first results from East Greenland banding initiated in 1955.

47770. SALONEN, JOUKO. Über das Vorkommen der Hydrophyten in den Stratiotes-Seen in Kittilä, Finnisch-Lappland; vorläufige Mitteilung. (Suomalainen eläin- ja kasvitieteellinen seura Vanamo. Tiedonannot (Archivum) v 10, no. 2, 1955, pub. 1956. p. 146-52, 2 tables.) 12 refs. Text in German. Title tr.: On the occurrence of hydrophytes in the Stratiotes lakes in Kittilä, Finnish-Lapland; preliminary report.

Botanical investigations of lakes and stream confluences in Kittilä, northern Finland, were begun in 1955. In this preliminary report, broad outlines of the problem are summarized. Size, elevation, bedrock, drainage, depth, water clarity and nutrient content are considered. The Stratiotes lakes are confined to the headwater region between the Jeesiöjoki and Ounasjoki drainage systems, where bedrock is chemically basic. Investigations at 17 stations, of more than a dozen lakes, are reported. Over 50 species of aquatic plants are dealt with and their occurrence recorded for these

waters (under study also by M. K. Kotilainen, q. v.). General trends of distribution of the hydrophytes, as well as the pH, transparency and fertility of the water are noted. *Copy seen:* DA.

47783. SANDFORD, KENNETH STUART, 1899– . The stratigraphy and structure of the Heela Hoek formation and its relationship to a subjacent metamorphic complex in North-East Land, Spitsbergen. (Geological Society of London. Quarterly journal, 1956. v. 112, pt. 3, p. 339–62, 3 illus., 3 maps incl. 1 fold., cross-sections, tables.) 15 refs. Summary and discussion also pub.

in the Society's Proceedings, session 1955-1956, no. 1531, p. 14-17.

Stratigraphic succession of the lower part of the Hecla Hoek formation (Precambrian and Lower Paleozoic) is coordinated for the various regions of Nordaustlandet for the first time. Upper part of the formation is found only in the northwest part of the island. Geology of Prins Oscars Land (80°10' N. 22° E.) on the north coast is described and interpreted, also for the first time. Hecla Hoek sediments are in successive plunging folds which end in the east against a fracture belt (Dove Bay fault). "The structure of the metamorphic complex beneath the Hecla Hoek formation is totally at variance with that of the overlying sediments, and the Dove Bay fault cuts the complex transversely." Relationship of the Hecla Hoek with the metamorphic complex recalls features of Norwegian and British geology. Copy seen: DGS.

47784. SANDSTRÖM, JOHAN WIL-HELM, 1875–1947. The working up of sea-surface temperatures. (International Council for the Exploration of the Sea. Rapports et procès-verbaux des reunions, Feb. 1943. v. 112, p. 63–75, text charts, 4 tables.)

"Monthly average sea surface temperatures in 1° squares are given for the period 1900–1937, covering the northeast Atlantic from 33° N. to 67° N. and showing also unsmoothed isotherms, deviating greatly from the temperature distribution published previously in various atlases. The basic data were supplied from the International Hydrographical Card Index. A classification of principal squares is proposed, superior to the commonly used Marsden squares."—Meteorological abstracts & bibliography, Jan. 1956. v. 7, no. 1, p. 26. Copy seen: DLC.

47785. SANDVIK, MARTIN. Noen betraktninger omkring plantekvalitet og gjødsling i planteskolen. (Norske skogplanteskoler. Årsskrift, 1955. p. 17–25.) 22 refs. Text in Norwegian. *Title tr.:* Some reflections about plant quality and fertilization in nurseries.

Includes in discussion of frost resistance, note of the fact that nursery plants suffer fall and winter frost damage because, being better fertilized, their greater vegetative activity leaves them unprepared for cold weather. This is related to top freezing of larch on good soil in northern Troms. Copy seen: DA.

47786. SANGSTER, A. G. A new approach to sled design. (RCEME quarterly, Jan. 1953. v. 5, no. 1, p. 14-17, illus., diagrs.) Similar in content to No. 31783, 37219.

Contains a description of a cargo sled designed by the Canadian Army. The final prototype weighs 1364 lb. with a rated payload of 2 tons. Light alloys are used for load-carrying members. All four runners turn as the drawbar is varied. The action of the suspension and floating runner provides an unusually smooth, level ride.

A study based on clinical observations made during the Expedition and on recent experimental and clinical work. The first, introductory chapter, deals with frostbite in modern wars; definitions, terminology and kinds of cold injury; frostbite proper and cold injuries without freezing: views on both types. The following sections deal with author's observations during the Expedition: effects of the environment; areas mostly affected; degrees of injury; clinical course (early period, rewarming, third period; infections; sequels); clinical forms and etiology, pathological physiology and pathogenesis theories, consecutive phases of the injury; treatment (rewarming, sympathetic intervention, vasodilators, anticoagulants, etc., surgery, treatment of sequels); prophylaxis. Copy seen: DLC.

47790. SAPIN-JALOUSTRE, JEAN and T. H. GODDARD. A French follow-up of research carried out in 1912 by Dr. A. L. MacLean of the Australasian Antarctic Expedition, 1911–1914, on the slowing down of the growth of hair and nails in Antarctica. (Medical journal of Australia, Oct. 1956. 43rd year, v. 2, no. 17, p. 639–41, illus., tables.) 9 refs.

A comparison is made of the techniques and results of Dr. MacLean's work with those of the Expéditions polaires françaises investigations in 1949–1951. Growth was mostly retarded when subjects lived outdoors and thus were exposed to low ambient temperatures. The phenomenon is explained as a result of diminished metabolism of the body surface caused by its lowered temperature.

47796. SAPOZHNIKOVA, S. A. Raboty agroklimatologicheskol ékspeditáii na Kol'skom poluostrove. (In: Khibinskie apatity, 1933. t. 6, p. 230–33, 3 illus.) Text in Russian. Title tr.: Work of the agro-climatological expedition to Kola Paniasula

Climatological data and physical geographical factors are discussed in relation to agriculture. Heat, light and humidity conditions are analyzed on the basis of data from the existing network of meteorological stations and temperature observation points. These data vary with time, geographic location and topographic position of the observation point. Characteristics of light variations are indicated by year-round actinometric observations. Agro-climatic divisions can be established for Kola Peninsula, enabling rational use of land in a given area.

47797. SARABHAI, V., and R. P. KANE. Effects at Godhavn and lower latitudes of changes in energy and composition of solar cosmic rays. (Physical review, Aug. 1953. v. 91, no. 3, p. 688–89, graph.) 3 refs.

"Time series have been derived for changes of the amplitude and the hour of maximum of the diurnal component of the daily variation of the pressure-corrected meson intensity at Godhavn, West Greenland (69°15′ N. 53°32′ W.) from Carnegie Institution data . . . The variability at Godhavn is much greater than elsewhere. Comparison of the series at Godhavn with the corresponding series for the mean changes observed at Cheltenham, Eng. and Christchurch, N. Z., permits information to be derived concerning changes in the mean energy of cosmic-ray primaries responsible for the daily variation, and their 'stiffness' in the geomagnetic field. On the basis of an interpretation in

terms of continuous emission of cosmic rays from the sun, there is evidence for an increase in the mean energy of solar cosmic rays from 1940 to 1944. Reasons are given for believing that during 1944, the solar rays became richer in alpha particles as compared to protons."—Authors' abstract.

47799. SARGENT, FREDERICK, and others. The physiological basis for various constituents in survival rations; the efficiency of young men under conditions of moderate cold. May 1955. 706 p. in 2 v., illus., tables. (U. S. Air Force. Wright Air Development Center. Technical Report 53–484, May 1955. pt. 2, v. 2.) 83 refs. Other authors: V. W. Sargent, R. E. Johnson, and S. G. Stolpe.

Contains (in v. 1, 378 p.) a comprehensive study of survival rations in moderate cold, tested on 99 volunteer airmen, during the period Feb. 22 through Apr. 4, 1954. Numerous observations were made in two-week periods on adequate, restricted, and recovery diets (with "luxus amounts" of vitamins in all cases) in order to determine "physiological, biochemical, nutritional, and clinical judgments on the relative effects of work, water, calories and protein/carbohydrate/ fat ratio in all-purpose survival rations." Starvation and a 3,000-calorie adequate ration represented the extremes of the Twenty different nutrient combinations were evaluated with respect to body function and efficiency. Below the optimal control ration, the highest score in hard and in light work was attained by supplying unlimited water, 2,000 calories per day with a caloric distribution of 15 percent protein, 52 percent carbohydrates, and 33 percent fat. Vol. 2 (p. 379-706) contains detailed data on the study presented in tables.

Part 1 of this study deals similarly with rations under temperate conditions.

Results are given of an analysis of the phase and amplitude of the diurnal and semi-diurnal components of the minimum virtual height of the  $F_2$  region based on hourly median values obtained from 36 world-wide ionospheric stations in Dec. 1945 and 39 in June 1946. A very large diurnal component found for high latitudes is considered unreliable. Components are plotted against geographic and geomagnetic latitudes.

47803. SAUVÉ, PIERRE. Preliminary report on De Freneuse Lake area, west half, New Quebec. Quebec, 1956. 6 p. fold. map. (Quebec, Province. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 332.) Ref.

Map (scale 1 in: 1 mi.) covers the area 58°15′-30′ N. 69°15′-30′ W., about 140 mi. northwest of Fort Chimo, southwest Ungava Bay region. Mapping was done in summer 1956. Most of the region is underlain by folded and metamorphosed sedimentary and volcanic rocks injected by numerous gabbro sills. Rocks are Precambrian and form part of the Labrador Trough. Granitic gneisses, possibly part of the crystalline basement of the trough, occupy a very small part of the area. Metamorphism increases toward the east. Structural trend is northwestsoutheast; structures are described. No mineral deposits of economic importance were found. Copy seen: DGS.

47804. SAUVÉ, PIERRE. Preliminary report on Leopard Lake area, east half, New Quebec. Quebec, 1956. 6 p. fold. map. (Quebec, Province. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 325.)

The area, 57°45′-58° N. 69°30′-45′ W. (about 55 mi. west of Fort Chimo) and immediately south of that described in No. 42281, lies in the middle part of the Labrador geosyncline and is underlain by sedimentary and basic volcanic rocks intruded by gabbro sills. The rocks have been folded along northwest-trending axes, folds generally upright, transverse faults abundant but displacement small. A few mineralized zones containing disseminated chalcopyrite and pyrrhotite were found. Erythrite or cobalt bloom was identified in one Copy seen: DGS. locality.

47805. SAVARENSKIĬ, EVGENIĬ FEDOROVICH. Izuchenie seismichnosti trudnodostupnykh oblasteľ; iz programmy Mezhdunarodnogo geofiziches-kogo goda. (Akademia nauk SSSR. Title tr.: Research on seismicity in inaccessible regions; from the program of the International Geophysical Year. Translated into English by E. R. Hope (5 p.) for Canadian Defence Research Board, Directorate of Scientific Information Service, T226R, Sept. 1956 (Copy at CaMAI).

Discusses studies planned for 1957-1958 by a team of seismographers in Arctic and Antarctic, headed by V. V. Belousov, corresponding member of the Academy of Sciences; new seismological stations are to be set up on Tiksi and Tikhaya Bays and at Apatity on Kola Peninsula. Proposed research is outlined on location of foci, intensity and frequency of earthquakes in inaccessible regions, including: antarctic, arctic, equatorial and tropical zones. Microseisms will be studied in connection with meteorological phenomena in oceans (typhoons, storms, cyclones, etc.); structure of the earth's crust will be studied with seismic methods. Special attention is given to seismicity of the Antarctic (little known), and the Arctic: along the active belt from Lena estuary across Laptev Sea and the Central Arctic, parallel with the Lomonosov Ridge, to Greenland and Iceland. Earthquakes in the Arctic and sub-Arctic are recorded by a chain of seismic stations in this active belt. Copy seen: DLC.

47806. SAVARENSKIĬ, EVGENIĬ FEDOROVICH. Problema fsunami. (Akademiß nauk SSSR. Sovet po setsmologii. Būlleten', 1956. no. 2, Sbornik statet po fsunami, p. 3-7.) Text in Russian. Title tr.: The problem of "tsunami."

Sudden appearances of the "tsunami" (seismic sea wave) on the shores of the Japanese Sea, including the Kamchatka-Kuril zone, are geologically explained. Their destructive effects upon harbor and river facilities and in loss of life among shore population are described. The only preventive measure is an automatic warning device, a sound signal, designed and arranged on the basis of a special hydro-acoustical study of this phenomenon.

Summarizes the observations of Soviet and foreign botanists on the biology and ecology of mosses in the winter season, B. A. Tikhomirov (q. v.) pointed out the important role of moss cover in the early development of arctic flowering plants from his observations on the Taymyr Peninsula. Mosses foster formation of coarse-grained snow and development of natural "hot houses" beneath the snow cover where the plants begin budding in the late-winter and early-spring period. Some spots covered by green grasses and small shrubs with well developed buds were found under the snow on hill slopes exposed to the sun. Of the biology of mosses in winter time very little is known Copy seen: DLC. as yet.

47808. SAVICH, VSEVOLOD PAVLOVICH, 1885—, and others. O novom antibiotike iz lishaĭnikov: natrievol soli usninovol kisloty. (Akademiíā nauk SSSR. Botanicheskii institut. Trudy, 1956, ser. 2, Sporovye rasteniíā, vyp. 11, p. 5–37, 12 illus., plate.) 62 refs. Text in Russian. Other authors: V. F. Kuprevich, M. A. Litvinov, E. N. Moiseeva, and K. A. Rassadina. Title tr.: On a new antibiotic compound from lichens: the sodium salt of usnic acid.

Following a brief review of the literature on antibacterial properties of lichens, results are reported of an investigation (1950-56) of several Russian lichens for the presence of usnic acid (table 3), the basic substance for various antibiotic preparations. The lichens studied were five species of Cladonia, Usnea (U. dasypoga), two each of Cetraria and Alectoria, Parmelia, Evernia, and Ramelina. Some species as Cetraria cucullata, C. nivalis, Alectoria ochroleuca are widely distributed in the tundra zone of the U. S. S. R., expecially in Yakutia. The antibiotic "Binan" or "Bin-7," a compound of sodium salt of usnic acid proved effective in hospital tests on open infected wounds, etc., and in treatment of tuberculosis and streptococcus infections; it is also used in maternity hospitals and clinics. Bin-7 as crystal powder or solution is simple in application; it is stable and effective at least for ten years; the raw material sources (lichens) are enormous; storage and preservation pre-Copy seen: DA. sent no problems.

47810. SAVILE, DOUGLAS BARTON OSBORNE, 1909— . Known dispersal rates and migratory potentials as clues to the origin of the North American biota. (American midland naturalist, Oct. 1956. v. 56, no. 2, p. 434–53, table.) 32 refs.

A critique of A. Wolfson's interpretations of the origin of American avifauna (No. 43358) and of the continental drift theory as explaining the origin of North American biota. Migratory capacities and dispersal rates of many organisms across water and adaptability to climatic change account for much of the disjunct distribution pattern; they support the assumption on the relative permanency of position of continents, with the Bering Strait and some other shallow sea barriers intermittently connecting them.

47812. SAVKINA, Z. P., and T. P. MESHKOVA. Opyt posadki zashchitnykh lesnykh polos i izuchenie ikh vlifanifa na mikroklimat v lesotundre. (Rastitel'nost' Krafinego Severa SSSR i ee osvoenie, 1956. vyp. 1, p. 81–92, illus., graphs., tables.) 14 refs. Text in Russian. Title tr: An experiment in shelterbelt forest planting and its influence on the microclimate in the forest-tundra.

Reports results of developing forest belts since 1950 to protect tundra vegetation at Nar'yan-Mar, Salekhard, Igarka, Berezovo, Taymyr and other stations of the Institute for Polar Agriculture. These belts now amount to 4 km. in length, and they cover approx. 20,000 sq.m. Picea obovata (2250) and Larix sibirica (1550) were mainly used, with 590

Betula verrucosa and B. tortuosa, thousand Salix viminalis and S. phylicifolia, 450 Pinus sibirica, 280 Sorbus aucuparia, 370 Alnus fruticosa, 50 Populus suaveolens, also some 200 shrubby Caragana arborescens. Larch and birch are the best species. Planting methods are briefly described. These belts are effective in mitigating the force of the wind, and for best results, should be planted at angles to the prevailing wind direction. Their effects on snow cover distribution, ground freezing and thawing, air temperature and humidity in adjacent areas are discussed. Copy seen: DLC.

47813. SAVVINA, Ū. A., and N. N. SERB-SERBINA. Vlifanie gidrokhlora-lūminatnykh soedinenil na prochnost' i dolgovechnost' fsementnogo kamnfa v betone. (Stroitel'nafa promyshlennost', Sept. 1956. god 34, no. 9, p. 31–36, illus., tables, graphs.) Text in Russian. Title tr: Influence of hydrochloraluminate compounds on the strength and durability of cement stone in concrete.

The use of calcium and sodium chlorides of high concentration in frost-resistant concrete is discussed as the formation of hydrochloraluminate compounds affect the strength and durability of the concrete. The high-chloride-content form of these compounds increases in volume during crystallization, and causes increase of internal stresses in the structure, hence lowering the strength and frost resistance of the cement stone. The kinetics of chemical and structural processes at low temperatures are analyzed. Ingredients and water must be

proportioned at temperatures to maintain

the plastic phase of the concrete suffi-

ciently long for stabilization of stresses.

The effect of these chlorides on shrinkage

of the concrete is treated by V. A.

Burenin, q. v.

Contains outline of the degree of interrelation between the severity of the arctic ice in the northern North Atlantic and the seasonal, annual and longerperiod variations in ocean and air temperatures, precipitation, and storm frequencies and mean storm tracks in that general area. The relationships of the ice with the contemporary and subsequent ocean and weather conditions are treated. Ice data for the Greenland Sea in general (since 1877) and the Barents Sea (since 1895) are treated. Tables showing the results of correlating the various ice data with oceanographic and meteorological data from the Arctic and adjacent areas by season, year and decade are included. Results obtained generally favor the theory that the arctic ice can serve as an index of ocean and weather conditions. The mean sea-ice limit in the Greenland and Barents Seas during Apr.-Aug. is a substantial measure of both the seasurface temperature near the Faroes and the east coast of Iceland, and the air temperature at Iceland, during the subsequent period Sept.-Feb. Decadal variations of arctic ice are a measure of decadal trends of ocean phenomena and weather in the region of the northern North Atlantic. Copy seen: DLC.

47821. SCHENK, ERWIN. Die periglazialen Strukturbodenbildungen als Folgen der Hydratationsvorgänge im Boden. (Eiszeitalter und Gegenwart, Aug. 1955. Bd. 6, p. 170-84, illus., diagr.) 33 refs. Text in German. Summary in English. Title tr.: Periglacial structural soil formations from hydration processes in the soil.

A theory on the mechanics of frost action in soils is developed. Soil is viewed as a polydispersed system of water, soil particles, and air. Phenomena taking place during freezing are attributed to hydration. The capacity of soil particles to absorb excess water during freezing is due to energy differences between the hydrating particles, and water movement is activated by the electric potential of the growing ice crystals

which is higher than that of the other components of the polydispersed system. **Copy seen:** DLC.

47822. SCHENK, ERWIN. Windorientierte Seen und Windablagerungen in periglacialen Gebieten Nordamerikas. (Erdkunde, Dec. 1956. Bd. 10, Heft 4, p. 302–306, illus, text map, diagr.) 11 refs. Text in German. Summary in English. Title tr.: Wind-oriented lakes and eolian deposits in periglacial regions of North America.

A description of the oriented lakes along the coast of northern Alaska, based on the literature of 1945–1951. As the north-south trend of the lakes does not coincide with present prevailing wind direction, wind direction and wind effects during the Pleistocene period must account for the phenomenon, an explanation favored by the colian deposits in these lake regions. Significance of these discoveries to interpretation of Pleistocene landforms in north and east Europe is noted.

The economic significance and planning of winter construction are discussed, and a detailed description of techniques used is presented. Specialized equipment including heaters, burners, and steam generators is described, and each construction phase is treated in turn. A cost analysis and calculations of heat requirements are given. The most important official directives and standards are cited. An extensive bibliography arranged by language is appended.

47833. SCHMID, JOSEF. Der Bodenfrost als morphologischer Faktor; eine analytisch-morphogenetische Untersuchung der Frostbildungsvorgänge im winterkalten humiden Klimabereich und Erörterung der Frostphänomene überhaupt. Heidelberg, Alfred Hüthig, 1955. 144 p., illus., diagrs., graphs (1 fold.), 8 tables. Text in German. Title tr.: 146 refs. Ground frost as a morphological factor; an analytical-morphogenetic investigation of frost action in cold-winter humid climatic regions and discussion of frost phenomena in general.

Phenomena associated with ground frost in cold humid climates and methods of measurement and analysis are reviewed. The various forms of frozen soil and unsolved problems of mass movement and exchange in the soil are stated. Discussion follows on the effects of freezing water, ice formation, and (in detail) frost

heave. The behavior of different soil types when affected by frost is described, and measurements are given of frost heave. The particular morphological effects of frozen soil on stones, plants, trees, etc., are considered, and final chapters are devoted to patterned ground and solifluction. The text is supplemented by many diagrams and statistical tables. It is reviewed by H. A. G. Nathan in Canadian geographical journal, Dec. 1956, v. 53, no. 6, p. xii, xv.

Bd. 11, Die asiatischen Hirtenvölker: die primär-sekundären Hirtenvölker der Jakuten und der Sojoten-Karagassen sowie der Jenisseier und die Synthese der benachbarten Nicht-Hirtenvölker. Münster i. W., Aschendorffsche Verlagsbuchhandlung, 1954. 27, 734 p. 40 refs. Text in German. Title tr.: The origin of the idea of God, an historicocritical and positive study. Part 3: The religions of pastoral tribes, V. v. 11. The Asiatic pastoral tribes: the primary-secondary pastoral tribes of the Yakuts and the Soyot-Karagas as well as the Yeniseians and the synthesis of the neighboring non-pastoral tribes.

Analyzes the indigenous religions of the Yakuts (p. 1-398), the Soyot-Karagas (Samoyeds) (p. 399-467) and the Yeniseians (p. 469-564). Their gods and highgod idea, white and black shamanism, magic, mythology, national epics, demonology, soul conception, mortuary customs, etc., are discussed, and the older and younger religious layers differentiated. A comparison is made between the religious beliefs of the central Asiatic pastoral tribes and their non-nomadic neighbors: the Yukaghirs (p. 569-87), the Tungus (p. 588-682, 713-16) and the Yeniseians (p. 683-712). This posthumous volume is in sequence with those of No. 37266. It is reviewed by Lawrence Krader in American anthropologist, Oct. 1955, v. 57,

A biographical sketch of P. W. Schmidt by Joseph Henninger and a review of his scientific achievements by Wilhelm Koppers were pub. in Anthropos 1956, v. 51, fasc. 1-2, p. 19-80. Copy seen: DLC.

From observations in Scandinavia, including Nordland in Norway and northern Norrbotten in Sweden, it is concluded that frost damage may result from a variety of combinations of weather and tree conditions. Cool, damp summers often leave immature growth that is subject to early frost. Elevation, location, temperature, humidity, and evaporation are considered. Copy seen: DA.

47843. SCHOLANDER, PER FREDRIK, 1905—, and others. Gases in icebergs. (Science, Jan. 20, 1956. v. 123, no. 3186, p. 104–105, table.) 8 refs. Other authors: J. W. Kanwisher and D. C. Nutt.

Contains results of studies on pieces of icebergs taken on board the research vessel Blue Dolphin along the Labrador coast during 1954. Most bergs in this area are of Greenland origin. A piece of ice was melted in mercury. gas phase and the dissolved gases in the melt water were analyzed separately and the results were totaled. Thirty pieces taken from six different bergs were analyzed; the oxygen content in all of the bergs is close to that of the atmosphere, 20.9 percent. Bubbles in the icebergs were found to be under 2-6 atm. pressure. The combined accuracy of the various measurements is estimated to about  $\pm 0.2$  percent by volume for the total oxygen and nitrogen. The pressure estimates are probably valid to within  $\pm 25$  percent. Copy seen: DLC.

Results of study carried out summer 1952 at Abisko Naturvetenskaplig Station in Swedish Lapland (68°20' N.) at about 1250 ft. above sea-level. Growth of various plants was investigated under conditions of (1) continuous full daylight (24 hrs.), (2) full daylight for the whole of the daily photo-period, and (3) full daylight for half of the photo-period, the other half consisting of either daylight reduced by shading or light from incandescent lamps or fluorescent tubes, all of the same low intensity. Data were collected on dry weight, leaf area, height, water content, epidermal cell size, net assimilation rate, time to flowering, stomatal aperture, and leaf posture. The experiments indicate that both the light source used to supplement natural daylight and the intensity of illumination have pronounced effects on plant structure and growth. The modification of growth tends in general to be toward minimizing the adverse effects of the reduced intensity or duration of light. The long-day response of sugar-beet, barley, and Hyoscyamus may be almost completely suppressed if the relatively low-intensity white light used as a supplement, is deficient in the red end of the spectrum. Copy seen: DLC. SCHWARTZ, I. L., see Itoh, S., and I. L. Schwartz. Temperature . . . swelling of liver slices . . . 1956. No. 45728.

Contains 16 photographs with explanatory text, illustrating phenomena characteristic of the area just east of Thule, North Greenland. During summer 1954, the author was engaged there in glaciological research: accumulation, ablation, refreezing of melt-water, ice movement, meteorological conditions and some moraine features. The scientific results are to be published as a report of the Snow Ice Permafrost Research Establishment of the U. S. Army Corps of Engineers.

Copy seen: DLC.

47853. SCHYTT, VALTER. Lateral drainage channels along the northern side of the Moltke Glacier, northwest Greenland. (Geografiska annaler, 1956. Årg. 38, häfte 1, p. 64-77, 6 illus., text map, diagrs.) 10 refs.

Describes the development of a major shear plane between the stagnant front of a glacier and the "active" ice behind, and the formation of moraine along this plane when the active ice, carrying bottom debris, overrides the stagnant front. This can be observed at the inland ice edge east of Thule. A similar process acting along the northern edge of the east-flowing Moltke Glacier (Sermerssuak, 76°35' N. 67°55' W.) between a lateral stagnant zone and the living glacier appears to explain formation of lateral channels observed there in summer 1954. Morainal deposits along the shear zone protect the underlying ice from ablation; a lateral ice ridge develops between the glacier's edge and a new depression in the active ice on the glacier side of the ridge, a depression caused by melting and stream erosion.

Contains note on archeological discovery in the northwest corner of Yukon Territory, made by R. S. MacNeish, q. v. Copy seen: DGS.

47855. SCIENCE. Oceanographic survey of the North Pacific Ocean.

(Science, June 3, 1955. v. 121, no. 3153, p. 794.)

Notes summer 1955 plans for Operation NORPAC, a survey by Canada, Japan and the United States including the Bering Sea, Aleutian waters and Gulf of Alaska. Investigations are to cover physical and biological oceanography and the results are to serve the fisheries of the three countries. Participating agencies, number of vessels and personnel, etc., are noted. Copy seen: DLC.

47856. SCIENCE. Twenty-two field research projects scheduled by the Arctic Institute of North America. (Science, Aug. 5, 1955. v. 122, no. 3162, p. 235.)

Notes summer 1955 projects at the Arctic Research Laboratory, Point Barrow, Alaska and in northern Canada and Alaska. They include geological, glaciological and biological studies, also investigations on geomagnetic problems, disturbances in radio transmission. Principal investigators are listed.

Copy seen: DLC.

47857. SCIENCE NEWS LETTER. Water under permafrost may cause odd behavior. (Science news letter, Jan. 7, 1956. v. 69, no. 1, p. 9, col. 2.)

Contains note on the work of Fritz Muller, Swiss geologist, according to whom ground heaving in permafrost areas might be partly attributed to subpermafrost water. Copy seen: DLC.

47858. SCOTT, DONALD CHARLES, 1930- . Record of perch, Perca flavescens, from Great Slave Lake, N. W. T. (Canadian field-naturalist, Apr.-June 1956. v. 70, no. 2, p. 99.)

On Nov. 28, 1954, a single specimen of yellow perch was caught. The specimen was a three-and-a-half-year old mature male, 11.9 cm. long, weighing 28.9 gm. The northern limit of perch has been reported previously as Lake Athabaska.

\*\*Copy seen: DA.\*\*

47859. SCOTT, EDWARD MARION. Nutrition of Alaskan Eskimos. (Nutrition reviews, Jan. 1956. v. 14, no. 1, p. 1-3, table.)

Contains information on the traditional Eskimo diet and its three types in Alaska; its nutritive value; ways of eating and preparing food. Transition to white man's diet, and its caloric value are discussed; experiments with gardening and reindeer are noted. The food-producing or wage-earning men comprise

only 21 percent of the Eskimo population. Immediate and long-range nutritional problems are considered, the latter as part of the general problem of attaining adequate income. Copy seen: DLC.

SCOTT, EDWARD MARION, see also Porter, V. S., and others. Anemia in western Alaska. 1956. No. 47428.

SCOTT, J., see Haddy, F. J., and others. The effect of cold upon . . . vessel resistance. 1956. No. 45365.

SCOTT, J. W., see Gunton, R. W., and others. Changes in cardiac rhythm . . . electrocardiogram . . . hypothermia . . . 1956. No. 45346.

SCOTT, PETER MARKHAM, 1909—, see Hanson, H. C., and others. The geography, birds, and mammals . . . Perry River . . . 1956. No. 45431.

47860. SCOTT, ROBERT F. The problem of biogeography in Alaska. (Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 208–211.) 8 refs.

Discusses an Alaska-Siberia land bridge during the Pleistocene and its role as a refugium for plants during the glacial maxima, based on Hultén (No. 7551). Peculiarities of Alaskan bird and animal distribution and migrations are noted as research problems requiring combined efforts of geologists, geographers, climatologists, anthropoligists, and paleontologists. Other fundamental biological phenomena should be studied, such as those associated with the genetics of morphological and ecological differentiation, also range-limiting factors in space and time.

Copy seen: DGS.

47863. SDOBNIKOV, V. M. Izmenenia v ornitofaune severnogo Taĭmyra. (Priroda, Sept. 1956. god 45, no. 9, p. 109–110, 2 illus.) 5 refs. Text in Russian. *Title tr.:* Changes in the ornithological fauna of northern Taymyr.

Writer's observations in 1949 and comparison with old records of bird distribution indicate that many birds have extended their area by 0°50′ to 4°30′ northward. Northern limits of five species as recorded by A. F. Middendorf in 1843 and by the author in 1948-49 are tabulated. Warming of the climate is suggested as the main contributing factor. 47864. SEAGRAN, HARRY L. Effect of pH and salt content on curd formation in canned salmon. (*In:* Alaskan Science Conference . . . 1953. Proceedings, *pub.* 1956, p. 77.)

Summary of investigation which showed that prevention of curd formation and fluid retention in canned salmon prepared from frozen fish were caused by muscle protein swelling and imbibing free liquid. This process was most pronounced above a pH of about 6.5 and in the presence of 2-5 percent salt in the flesh.

"The effects of the low temperature and impermeability of permafrost on the freezing, chemical composition, distribution and run-off of ground water are analyzed, and the methodology of studying ground water is outlined. Observations are recommended twice yearly, in the spring and near the end of summer or at the beginning of autumn. Spring investigations are important for measuring minimum temperatures, locating thawed spaces in permafrost and studying ground icings. Autumn observations are needed to determine permafrost depth, the distribution of ground water and the effect of microrelief on permafrost."-SIPRE. Effects are noted (p. 51) of water reservoir, mining and other installations upon ground water in permafrost.

47873. SEELYE STEVENSON VALUE & KNECHT, Consulting engineers. Report on water supply for the DEW Line. New York, Feb. 10, 1956. [214] l. illus., diagrs., charts, maps, tables.

Results are given of an inspection made during Nov.—Dec. 1955 of the natural water supply at various points along the Distant Early Warning Line. Recommendations are made on adequacy of the water, its treatment and delivery methods. Techniques proposed for treating the water include sterilization, filtration, softening, iron removal, and pH adjustment. Manual delivery methods as well as heated and unheated pipelines are proposed. Adequate water supplies were found at all sites except one.

47878. SEGUIN, RICHARD L. Limites géographiques et facteurs climatiques de la distribution naturelle de la truite mouchetée. (Revue canadienne de géographie, Apr.—Sept. 1956. v. 10, no. 2–3, p. 113–17, text map.) Text in French. Summary in English. *Title tr.:* Geographic limits and climatic factors in the natural distribution of speckled trout.

The speckled trout (Salvelinus fontinalis) is indigenous only to the northeast of North America. In Canada it is found throughout the Maritime Provinces, Labrador and Quebec, most of Ontario and northeast Manitoba (including Hudson and James Bay regions). Its area of distribution is limited on the north and northeast by Hudson and Davis Straits, on the east by the Labrador Sea and North Atlantic, and on the west by the line at which annual surplus precipitation becomes less than four inches. Distribution in United States is also discussed. Copy seen: DGS.

SEIBERT, RICHARD ALBERT, 1913-, see Handley, C. A., and R. A. Seibert. The biochemistry of tissue trauma: muscle protein. 1956. No. 45419.

Text in Russian. *Title tr.:* Use of hydrophobic earth for elimination of frostheaving. Translated by E. R. Hope, as Canada, Defence Research Board, Directorate of Scientific Information, T236R, Ottawa, Nov. 1956. Copy at CaMAI.

The method and results are given of a laboratory study to determine the feasibility of using a layer of hydrophobic soil as a barrier against water migration from the subsoil and thus reduce frost heaving. The results indicated that the use of such an earth layer reduced soil humidity by 400 percent and soil heaving by 1400 percent. Hydrophobic earth may be prepared from the heaving soil itself, especially when the use of coarse-grained materials is expensive.

47887. SELMER-OLSEN, ROLF S. Om norske jordarters variasjon i korngradering og plastisitet. Oslo, Aschehoug, 1954. 102 p., 5 illus., 34 diagrs., 13 tables. (Norway. Geologiske undersøkelse, nr. 186.) Text in Norwegian. Summary in English. Title tr.: On the variations in particle size and plasticity of Norwegian soils.

Study was made to determine what a particle size curve can reveal of conditions of soil deposition, and how plasticity of Norwegian clay varies. Samples of eolian, strand, glacial lake, fine-grained marine, glaciofluvial, morainal, and post-Glacial river materials were subjected to laboratory analysis. Various kinds from arctic locations in Norway and several from Svalbard (list p. 65) were tested. Some comparisons are made between American and Norwegian analytical procedures, and between foreign and Norwegian clay, the latter, generally, having low plasticity. Copy seen: DGS.

Describes this moth, the caterpillars of which damage various species of cultivated onion (Allium cepa, A. fistulosum, A. sativum and A. schoenoprasum) in Krasnoyarsk province (Yartsevo, 64°11′ N. 90° E.). This species is related to the common onion moth, Acrolepia assectella, but can be easily distinguished by the structure of male and female genitalia. Spraying with DDT and regular removal of infected (yellow) parts of the onion are recommended for control of this pest.

Botanicheskie materialy, 1956. t. 11, p. 84-98, 4 illus.) 16 refs. Text in Russian. *Title tr.:* Seasonal changes of phytoplankton in the western section of

the Bering Sea.

Fluctuations of the biomass and phytoplankton content were studied from collections of the research vessel Vitiaz' May-June, Aug.-Sept., Sept.-Oct. and Dec.-Jan. Results for Kamchatka waters, Olyutorskiy Bay, Anadyr Gulf, and the oceanic zone are presented in The fluctuations in general are more pronounced in the neritic continental shelf than the oceanic zone. In the spring time, arctic and arcto-boreal species are predominant and the biomass is at a maximum in the neritic zone; in autumn, the biomass is smaller but still substantial, and boreal species are in majority. The flowering of the sea water is more active in spring than fall. The biomass has two maximums, spring and autumn, in Kamchatka and Olyutorskiy regions; only one (autumn) was observed in Anadyr Bay and the oceanic zone. In winter time, the biomass is small in both coastal and oceanic zones and boreal oceanic diatoms are predominant. Copy seen: DLC.

47899. SEMINA, G. I. Sostav i raspredelenie fitoplanktona v severozapadnol chasti Tikhogo okeana vesnoi i osen'fü 1955 g. (Akademifa nauk SSSR. Doklady, Sept. 21, 1956. t. 110, no. 3, p. 465-68, text map.) 13 refs. Text in Russian. Title tr.: Composition and distribution of phytoplankton in the northwestern part of the Pacific Ocean during the spring and autumn of 1955.

Includes data on the boreal zone in Commander Islands-Kamchatka Peninsula region, which may be divided into two subzones: neritic, along the coast of Kamchatka and the northern Kurils, and oceanic, the rest of the region. In the neritic subzone, 36 algal species were found, of which 31 belong to diatoms; Thalassiosira nordenskiöldii (90 percent of the biomass), T. gravida, Chaetoceros furcellatus, and some other diatoms, the most important species. The oceanic subzone is poor in phytoplankton; Chaetoceros concaviocornis f. volans and Rizosolenia hebetata are common boreal species. This study is based on materials collected by the Vitiaz' in May-June and Sept.-Oct. 1955; they are similar to collections of previous years and resemble phytoplankton of the Bering Sea.

Hines.

In rats, following immersion of hind legs in 0° C. baths for three hours, muscle injury was found to be a result of motornerve damage. Motor nerve denervation alone produced similar changes, and limbs in such condition when exposed to cold showed no greater atrophy or loss of strength than unexposed denervated legs. Hamsters exposed to similar treatment showed no damage.

Narody Sibiri, 1956. p. 543-69.) 7 refs. Text in Russian. Title tr: Socialist construction among the peoples of northern Siberia and the Far East.

Sketches the cultural backwardness of the north Siberian natives before the Revolution, total economic collapse during the foreign intervention, and progress since Komitet Severa (Committee for the advancement of the small peoples of the North) was set up in 1924, for 27 ethnic groups, 26 in Siberia. The scientific expeditions, study of local economic factors, administration and financial measures are outlined, with discussion of the new cooperative trade organizations and kolkhozes (75 percent of all households were collectivized by 1939-1940), emancipation of women, etc. The changes and adaptation of local customs to new living conditions are described; transition from nomad to settled life, adoption of the Russian log cabin, izba (instead of, or as annex to, the old semimud house, furta) and portable iron stove, erection of bath-houses, gradual disappearance of old food taboos, introduction of cheap, store-bought Russian clothes and continued use of local clothing for severe weather activities. An innovation among Chukchis and Eskimos, cloth-lined fur bed-curtains equipped with windows and ventilation openings is noted (p. 565).

(Anesthésie et analgésie, Dec. 1955. t. 12, no. 5, p. 865-69, table.) 4 refs. Text in French. Summary in English. Title tr.: Increase of respiratory anatomical dead space in dogs under experimental hypothermia.

In animals under artificial respiration, cooled down to 25° C. with ice, this increase amounted to 89 percent when chloralosis was used as anesthetic, and to 66 percent when nembutal was applied. It is believed that this increase is due to inhibition of vagal tonus during hypothermia.

47910. SEVERINGHAUS, JOHN W., and M. A. STUPFEL. Effects of hypothermia on pulmonary function. (Federation proceedings, Mar. 1956. v. 15, no. 1, pt. 1, p. 168.)

Account of observations on anesthetized, curarized and artificially ventilated dogs, made prior, during and after surface cooling to 22°-26° C. Dead space, blood and gas distribution, blood pH and gas tension, etc., were determined.

\*\*Copy seen: DLC.\*\*

47911. SEVERINGHAUS, JOHN W., and M. A. STUPFEL. Respiratory physiologic studies during hypothermia. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia. . . symposium, Oct. 1955, pub. 1956. p. 52–57, illus. tables.) 8 refs.

Following an analysis and re-calculation of certain physiological values in hypothermal respiration (O<sub>2</sub>- and CO<sub>2</sub>tension, pK¹), anatomic, physiologic, and alveolar dead space, and concommitant perimeters are investigated. It is concluded that hypothermia leads to increased anatomic dead space. No difficulty in elimination of CO<sub>2</sub> has been noticed. **Copy seen:** DLC.

47912. SGIBNEV, ALEKSANDR. Bol'shoĭ Kamchatskiĭ nariâd; ekspedi siiâ El'china. (Morskoĭ sbornik, Dec. 1868. t. 99, no. 12, p. 131–39.) Text in Russian. Title tr.: The Great Kamchatka enterprise; Elchin's expedition.

Cossacks' discoveries and conquests at beginning of the 18th century drew attention of the Department for Siberian Affairs (Sibirskii Prikaz) to northeast Asia. A large, well equipped expedition was commissioned in 1716 with Colonel IAkov Alekseevich Elchin (El'chin) as head, to explore the area, including Kamchatka and Chukotka. By 1718, personnel and equipment were assembled in Yakutsk. Several advance parties were sent to the Kolyma and Anadyr' River mouths and to the Okhotsk seacoast, while the main expedition was to move to Okhotsk as its base for exploration. Lack of roads, inexperience of the leaders and rivalry of the local administration delayed progress, and Elchin was summoned to S. Petersburg. In his absence, the expedition became completely disorganized and in 1720 it was called off. A visit to Shantarskiye Islands by one of its parties was the sole and meagre result of this costly undertaking. Copy seen: DLC.

47914. SHAMBAUGH, GEORGE. Temperature receptors, an annotated bibliography. Natick, Mass., Apr. 1956. 4, 55 p. Process print. (U. S. Army. Quartermaster Research & Development Command. Environmental Protection Research Division. Technical report EP-24.)

In four sections, dealing successively with temperature receptors in man, and in animals (references listed chronologically and briefly annotated); the effect of chemicals on temperature receptors (alphabetical listings, annotated); the fourth section is an alphabetical list of the above references cross-indexed, together with additional pertinent references; in all some 250 items are included covering the period 1840–1955. Copy seen: DNLM.

47915. SHAMOV, GRIGORII IVANO-VICH. Rechnye nanosy; rezhim, raschety i metody izmerenii. Leningrad. Gidrometeorologicheskoe izd-vo, 1954. 546 p. tables, graphs, maps, charts. 57 refs. Text in Russian. *Title tr.:* River deposits, processes and methods of measurement.

Textbook for hydrometeorological institutes, approved by Main Administration of Universities, Economics and Law Colleges of the Ministry of High Educa-

tion, U.S.S.R.

Formation and character of deposits and their granulometric composition are analyzed for various rivers in the U. S. S. R. including those of the North: the Ob', Yenisey, Lena and their tributaries. Distribution of average sedimentation and type of deposits along different rivers are mapped (figs. 7, 8, 31, 54) and their monthly averages tabulated (table 35–37). Various methods and bathometers for measuring suspended and bottom sediments, also other laboratory equipment are described (p. 270–332). Formulas and processes for computation of data are given (p. 332–43).

Copy seen: DLC.

47916. SHAMOV, GRIGORII IVANO-VICH. Stok vzveshennykh nanosov rek SSSR. Leningrad, Gidrometeorologicheskoe izd-vo, 1949. 119 p. diagrs, maps, tables. (Leningrad. Gos. Gidrologicheskii institut. Trudy, vyp. 20 (74)). 23 refs. Text in Russian. Title tr.: Run-off of suspended river deposits in the U. S. S. R.

Regional and seasonal variations in basic river characteristics are analyzed. A uniform method is applied, with consideration of physical and geographic factors, as essential for hydraulic-engineering projects and hydrometric services. Distribution of average turbidity in rivers of the European and Siberian (including arctic and subarctic) regions is plotted on fold. map (p. 16). Average monthly deposits and turbidities are graphed for rivers of various regions (p. 17-39). Catchment area, and annual data on discharge of transported deposits, water discharge and turbidity are tabulated (p. 45-70); and average monthly values are tabulated (p. 71-119). Included are rivers of the White and Barents Sea TSil'ma, Onega, (the Pizhma, Kem', etc.), of the Kara Sea basin (the Ob', Yenisey, etc.), Laptev Sea (Lena, Vitim, Aldan), basins of the East Siberian (Kolyma) and Okhotsk (Magadan) Seas, and rivers of Kamchatka Peninsula.

The process of combining small fishing vessels into a specific fleet is described in detail. In addition to the regular fishing vessels, auxiliary ships are attached to the fleet to serve as tug, rescue, fuel, fresh-water and food supply, hospital, search, inter-communication, etc., ships. Signal codes for guidance in maneuvering a large number of ships are discussed (p. 47-149) and illus; specific types of

formations are shown. Methods of loading and towing in a heavy sea are described with illus. (p. 150–258, 279–309). Navigation of ships in formation through ice (drift and pack), in narrow waters, and heavy ship traffic, during a storm, and in heavy seas is described (p. 258–78) with suggestion of the best formation in each case.

47922. SHARP, ROBERT PHILLIP, 1911— Last major advance of Malaspina Glacier, Alaska. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1782.)

Abstract of paper submitted for Society meeting in Reno, Nevada, Mar. 29–31, 1956. Trees growing in ablation debris on stagnant ice at the outer margin of this piedmont ice sheet (59°50′ N. 140° 30′ W.) and remnants of interglacial forests overridden by glacier fix date of culmination of the last advance at 200±50 yrs. ago. This was the most extensive advance in many hundreds, possibly thousands, of years. Copy seen: DGS.

47923. SHARP, ROBERT PHILLIP, 1911—
rocks of the central St. Elias Mountains, Yukon Territory, Canada. (American journal of science, Feb. 1956. v. 254, no. 2, p. 110-22, illus., text map, section.) 22 refs.

In summers 1948 and 1949 during glaciological work on upper Seward Glacier (Project Snow Cornice), observations were made of scattered bedrock exposures in the region 60°20'-30' N. 139°50′-140° W. Principal rocks are metamorphic and representive of the amphibolite facies of medium grade regional metamorphism. Four units are distinguished: biotite gneiss, schists, amphibolite and marble, igneous gneiss. All rocks are older than Lower Cretaceous. At the east end of the Mt. Logan massif are some early Lower Cretaceous graywacke, limestone, quartzite, and conglomerate beds. These and the metamorphic rocks are intruded by post-Lower Cretaceous quartz diorite bodies and lamprophyre dikes. Principal structural trends are noted. Copy seen: DGS.

47924. SHATALOV, E. T. Novye geologicheskie karty Sovetskogo Soûza. (Akademiîâ nauk SSSR. Vestnik, Oct. 1956. god. 26, no. 10, p. 28–34.) Text in Russian. Title tr.: New geological

maps of the Soviet Union.

Description and evaluation of four maps published by the All-Union Scien-Research Geological Institute (VSEGEI) in 1955 and 1956: two on the geology of the U.S.S.R., in scales 1: 2,500,000 and 1: 5,000,000; a geological map of the Siberian platform, 1: 5,000,000 and a tectonic map of the U.S.S.R. in scale 1: 5,000,000. Post-war progress in mapping (disappearance of "white spots," etc.) is noted. New aspects of the geology of arctic and subarctic areas (Chukotka, the Anabar River basin, Kola Peninsula), as reflected in the maps, are stressed. The Scientific Research Institute for Geology of the Arctic participated in the compilation of the maps.

Copy seen: DLC.

47925. SHATALOV, E. T. Vystuplenie zamestitelîâ ministra geologii i okhrany nedr SSSR E. T. Shatalova. (Akademiñ nauk SSSR. Laboratoriñ geologii ugliâ. Trudy, 1956. vyp. 5, Materialy vtorogo ugol'nogo geologicheskogo soveshchaniñ, p. 12–16.) Text in Russian. Title tr.: Address by E. T. Shatalov, Deputy Minister of Geology and Conservation of Mineral Resources of the U. S. S. R.

Outlines tasks of exploration of the coal resources of the U. S. S. R.; need is stressed (p. 14-15) to study coal-bearing areas in the Tungusskiy basin, where coal seams 70 m. thick have been found in the Kokuy mine. Copy seen: DLC.

47926. SHAUL'SKIĬ, F. I., Editor. Sukhoputnyī transport lesa. Moskva, Goslesbumizdat, 1951. 818 p. illus. graphs, diagrs. incl. fold. in pocket, also map. Refs. Text in Russian. Title tr.: Land transport of lumber.

A textbook for technical and agricultural forestry schools compiled by V. V. Buvert, B. D. Ionov, M. I. Kishin-

skil, and S. A. Syromatnikov.

Methods of timber transport are described and illus. in detail, and discussed in relation to topography and available mechanical power. Initial trailing and general transportation may represent 60–70% of the cost. Methods and mechanical equipment (including tractor trains) for hauling the logs from cutting site to loading or storage dumps are described by B. D. Ionov (p. 91–188).

Winter roads on snow, ice, or over marshland are dealt with by M. I. Kishinskii (p. 191-315): materials, permissible loads, character of wear, protection from drifting snow. Maintenance and operating equipment include: scrapers, graders, plow, water tanks and pumps on sleds, and sleds for heavy loads. Operational characteristics of transportation are mathematically analyzed for different permissible loads, strength of snow or ice roads, and composition of sled train (number of components). Roads, bridges and causeway construction over marshland is described in detail by B. D. Ionov (p. 435–59) with computation of stresses.

\*\*Copy seen: DLC\*\*

47927. SHAW, DONALD A. Real cool landings. (Flying safety, Jan. 1956. v. 12, no. 1, p. 4–8, 10 illus.)

"Research undertaken since 1946 by various U. S. agencies on the use of ice for airfields is outlined, and the first test landings made on land and sea ice are reviewed. Landing rules and the method of selecting emergency landing spots are discussed. Sea-ice thickness can be estimated by low-flying airplanes by the height of the ice edge above water or the thickness of upended floes. Sea ice suitable for landing is found in the Canadian Arctic from Dec.-May. Greenland sea ice is treacherous but the icecap is ideal for landings. Good landing spots are found in Alaska only on the north and northwest coasts. The Arctic Ocean offers many landing facilities on floes throughout the year."-SIPRE.

47928. SHCHERBAKOV, DMITRII IVANOVICH. Na samolete po Arktike. Leningrad, Gos. izd-vo detskol lit-ry, 1956. 144 p. illus., maps incl. fold. Text in Russian. Title tr.: Into the

Arctic by airplane.

In April-May 1954, the author, Secretary of Dept. of Geology and Geography of the Russian Academy of Sciences, accompanied the Chief of Main Administration of the Northern Sea Route, V. F. Burkhanov, on an inspection trip (fold. map) of the beginning of the High Latitude Expedition's work and the setting up of drifting stations North Pole-3 and -4. The party flew from Moscow, Apr. 26, via Amderma, Dikson and Franz Joseph Land to the vicinity of the North Pole and to the drifting stations North Pole-3 and -4; thence, along the north

Siberian coast to Cape Chelyuskin, drifting station North Pole-3, and returned over the North Pole and Dikson, to Moscow. In Aug. 1954 Shcherbakov made an air trip to Franz Joseph Land. Popular account is given of these flights, with added (p. 93–107) description of fauna of Franz Joseph Land and other arctic islands: polar bear, seal, walrus, birds; and chronicle of the conquest of North Pole, noting work of the Soviet High Latitude Expeditions and drifting stations in 1954 and 1955. Illus. show landscape, wildlife, polar stations, conditions of life and exploration in the visited places.

15, no. 1, pt. 1, p. 482-83.)

Chlorpromazine, dinitrophenol, Hydergine, ergotamine, lysergic acid, diethylamide and serotonin were found to produce hypo- and/or hyperthermia at certain "critical" ambient temperatures. In addition to ambient temperature, interference with central temperature regulating mechanisms was found in many cases to affect these responses.

47937. SHENITZ, HELEN A. Vestiges of old Russia in Alaska today. Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 249.) Ref. Abstract of paper pub. in Russian review Jan. 1955. v. 14, no. 1, p. 55-59 (Copy in DLC.)

Culture elements introduced by Russian peasants have been maintained by Aleuts and by Eskimos around Bristol Bay. Russian terms, ritual of Russian Orthodox Church, and various ethnographic traits can be recognized. Natives who call themselves "Russian" are descendants of mixed Russian-native marriages, but have no interest in old Russia or in the Soviet Union.

Text in Russian. Title tr.: Breeding work with the Siberian sled dog in the experimental hunting-dog-breeding farm of the All-Union Scientific Research Institute of Hunting.

Account of controlled breeding of two families of dogs from parents taken in the taiga region and the Khanty-Mansiysk National District. This work started in 1944. Copy seen: DLC.

47940. SHERESHEVSKIĬ, EDMUND IOSIFOVICH., and P. A. PETRÍAEV. Spravochnik okhotnika-polfarnika. Moskva-Leningrad, Izd-vo Glavsevmorputi, 1949. 316 p. illus., tables. Over 150 refs. Text in Russian. Title tr.: Handbook of the arctic hunter.

Presents a collection of information useful to the hunter, trapper or fur trader in northern U. S. S. R. The 12 chapters deal in turn with: arctic hunting and trapping (p. 5-13); fur trade (p. 14-80); the wild reindeer and its hunting (p. 81-90); the skins of arctic fur animals (p. 91-113); hunting sea mammals (p. 114-47); arctic game birds and their capture (p. 148-80); various trades (p. 181-200); study of commercial animals (p. 201-217); dog driving (p. 218-39); reindeer driving (p. 240-59); equipment and weapons of the arctic hunter (p. 260-82); local food and forage resources (p. 283-307). Chapters 2, 3, 5, 8, 9, 11 are by Shereshevskil; 1, 4, 7, 10, 12 by Petraev; and chapter six was contributed by P. P. Smolin. Literature references are included as relevant.

In the course of the handbook, the main arctic animals and birds of economic importance are described as to their distribution, habits, reproduction, food, enemies, etc. Methods and means of hunting or trapping them, skinning, dressing, utilization of meat, etc., are explained; also their capture alive for zoological gardens. Among the wildlife dealt with are the arctic fox (p. 15-49 and 91-103), ermine, weasel, fox, snow hare, marmot (Marmota camtschatica Pall.), suslik (Citellus eversmanni Brundt), wolf, wol-

verine, and polar bear (p. 64-78 and 110-13); the wild reindeer (p. 81-90). Several species of seals are covered: Phoca hispida, P. vitulina, Histriophoca fasciata, H. groenlandica (p. 114-24), also bearded seal, walrus, beluga, etc. Game birds, dealt with by Smolin, include the ptarmigan (p. 156-60), geese, ducks, swans (p. 170-71), eider, auk, loon, snipe, gulls, etc. Supplementary feeding of the wild arctic fox in areas of its occurrence is prescribed and instructions are given (p. 201-217) on the observation and recording of useful data on wildlife. Problems of transportation in the Arctic are dealt with (p. 218-59) and breeds of sled dogs, the harness, hitches, and sleds, are described and illustrated; the use of dogs for pulling river boats and for carrying loads is included. The seasonal migration of reindeer is discussed, the training of both reindeer and drivers is explained, and the harness and sleds are described. Winter and summer clothing for hunters is discussed, their sleeping bags, tools, snow goggles, weapons, etc., the huts, tents, construction of snowhouses are explained and diagrammed. Advice is given on food, the preservation of meat and fish, reindeer milk, birds' eggs, and mushrooms, dietary needs, cookery, etc. Feed and requirements for dogs (including pemmican) and reindeer are tabulated and discussed (p. 304-308). The local Russian names of the main fur bearers and sea mammals are given (p. 79 and 146) together with the Nentsy (Samoyed), Yakut and Chukchi names. The collecting of mammoth and walrus ivory is mentioned (p. 194-95). pended (p. 308-316) is a hunters' calender, Russian and Latin names of 21 main fur animals and 118 arctic birds, with tabulated data on the birds' occurrence on Russian arctic mainland and islands. Copy seen: DLC.

47942. SHEVCHENKO, M. I. Rezul'taty poiskovykh i razvedochnykh rabot v vostochnol chasti apatito-nefelinovof dugi Khibinskikh tundr. (In: Khibinskie apatity, 1933. t. 6, p. 35–36.) Text in Russian. Title tr.: Results of searching and prospecting work in the eastern part of the apatite-nepheline arch in the Khibiny.

Eastern Rasvumchorr, Suoluayv and N'orkpakhk regions were investigated in 1933 for apatite deposits and related inlite-urtite rocks of industrial significance. A deposit of dense urtites was discovered in the Koashva plateau with vein estimated at 1.5 km. long, 20 m. thick and 100 m. deep. Deposit of iolite-urtite rocks of granite-porphyric structure (2 km. long and 150 m. thick) was found on the northeast slope of the Rasvumchorr. Work was continued on the southern and eastern slopes of the N'orkpakhk. Copy seen: DGS.

47943. SHEVKO, E. I. Vetrodvigateli. Kiev, Gos. nauchno-tekhnicheskoe izd-vo mashinostroitel'nol literatury. Ukrainskoe otdelenie, 1955. 115 p. diagrs., tables. 10 refs. Text in Russian. Title tr.: Wind-driven motors.

Theory and classification of wind motors are briefly outlined in respect to size, speed, and relative position of the wind motor. Construction details of various installations (UTV-5, TV-8, D-5, D-12 and D-15) are given, with marked dimensions for major parts. Special instructions are outlined for assembly, repair and servicing of those installations under normal and adverse weather conditions, including de-icing and lubrication in low winter temperatures by lubricants diluted with kerosene.

Moskva, Goslesbumizdat, 1956. 88 p. illus., tables. 41 refs. Text in Russian. Title tr.: Reforestation on concentrated cuttings in pine forests of the taiga zone in the European part of U. S. S. R.

The coniferous forests and climatic conditions of the northern taiga from Kola Peninsula to the Northern Ural are characterized. Maritime and continental arctic air movements are discussed in relation to the snowfall and duration of snow cover, and their influence upon the growth of typical species: Picea fennica Rgl., P. excelsa Link, Pinus silvestris L., Larix sukaczewii Djil. and others. Conditions for growth are considered in relation to the various (northern, central and southern) taiga zones. Systematic cutting for natural seeding in the northern zone is described in detail, with attention to a variety of soil conditions. growth of young pine and birch is affected by the character of the ground cover and vegetation: swamp moss, heath, red bilberry, lichens, sphagna, etc.

47951. SHISHKIN, ALEKSANDR ALEKSANDROVICH. Osobennosti stroitel'stva iz krupnykh kirpichnykh blokov v zimnikh uslovi@kh. (Stroitel'na@a promyshlennost', Jan. 1956. t. 34, no. 1, p. 12-15, illus., diagr., tables.) Text in Russian. Title tr.: Special construction

with large brick-blocks under winter conditions.

Winter building with bricks pre-laid in large blocks (1.30 x .51 x .90 m.) is described. The blocks can be prepared in heated sheds or in the open with a freezing method. Both ways were investigated in the laboratory before practical application, and the results are presented for range of temperatures between  $0^{\circ}$  and  $-22^{\circ}$  C., also for both careful and rough handling. The investigation also indicates that the frozen brick block, as frozen concrete, the ground itself, etc., possesses valuable physical and mechanical properties: high degree of strength, monolithic character and shock resistance. In assembling the frozen blocks, precautions should be taken against their sagging during thaw (at about 1 mm./m. height) to prevent loss of strength and stability in the walls.

47952. SHISHKIN, ALEKSANDR ALEKSANDROVICH. Vliūnie usloviī nachal'nogo promerzaniū zimneī kladki na ee fiziko-mekhanieheskie svolstva. (Stroitel'naū promyshlennost', Sept. 1956. god 34, no. 9, p. 23–27, illus., table, graphs.) Text in Russian. Title tr.: The effect of initial freezing of winter masonry upon its physical and mechanical properties.

The study of frozen mortar in the masonry work conducted in the Laboratory of Institute of Permafrostology is described with illus. and curves. results are analyzed with mathematical formulation of the relation between masonry strength and temperature. The significance of the initial freezing is considered in regard to evaluation of expected strength of construction after thawing. With initial freezing at the temperature -22° C., the force causing deformation was found about 21 percent of that corresponding to summer conditions; at the temperature -10° C. the force was about 67 percent and at -1° C. was about 123 percent. The magnitude of masonry deformation in very cold weather, considerably affects the plastering, facing and other covering Formation of ice entrapped work. between the bricks and mortar lowers the adhesion of these materials at thawing, especially after initial freezing at low temperature. These characteristics must be specially considered for construction in seismic regions. Copy seen: DLC. SHISHO, G. A., see Kurinnyl, T. G., and others. Previously listed as No. 15948.

Describes the archeological finds of the summer 1928 Kola expedition of the Academy of Sciences U. S. S. R. Its five-man paleontological section, headed by D. A. Zolotarev and including the author, excavated eleven late "arctic neolithic" burials on Bol'shoy Oleniy Ostrov (63°13' N. 33°29' E.). The island's fauna, flora and geology are described. The skeletal remains and artifacts discussed include bone and stone knives, harpoons and throwingsticks, fishhooks, arrow heads, scrapers, ornaments, etc. Only one (imported?) bronze or copper arrow head and a few potsherds were unearthed. The finds are compared with those from the 1907–1908 excavations of O. Solberg on Kjelmøy Island (No. 32172) and a dating of 500–1000 B. C. is suggested. Similarities are noted between these and the proto-Eskimoan cultures discovered in eastern Asia, northern America and Greenland. N. N. Gurina (q. v.) later utilized Shmidt's work.

47963. SHOEMAKER, CLARENCE RAYMOND, 1874-1958. The amphipod genus *Corophium* on the west coast of America. (Washington Academy of Sciences. Journal, Feb. 15, 1949. v. 39, no. 2, p. 66-82, 8 illus.)

Contains a synopsis of the genus and descriptions of 13 species, five new. C. brevis (Stephens Passage, Alaska), C. clarencense (Port Clarence, Alaska), n. spp. and four other species, recorded in Bering Sea and Aleutian waters, are included.

Copy seen: DLC.

47964. SHOEMAKER, CLARENCE RAYMOND, 1874-1958. Further notes on the amphipod genus Corophium from the east coast of America. (Washington Academy of Sciences. Journal, Feb. 15, 1947. v. 37, no. 2, p. 47-63, 12 illus.)

Contains a synopsis of this genus, illustrations and descriptions of 12 species. C. acherusicum ranging from Baffin Bay to Brazil on the east coast and from Alaska to Monterey, on the west coast of America, is included. This paper is supplementary to No. 47962.

Copy seen: DLC.

47965. SHOEMAKER, CLARENCE RAYMOND, 1874–1958. Notes on the amphipods Eurythenes gryllus (Lichtenstein) and Katius obesus Chevreux. (Biological Society of Washington. Proceedings, Dec. 31, 1956. v. 69, p. 177–78.)

Contains critical revision of these closely allied amphipods, recognized as two distinct species of the genus Eurythenes. Both species were taken at Tromsø, Norway. E. gryllus was also recorded by J. Murdock in 1885, during the International Polar Year Expedition

to Point Barrow, Alaska. These specimens have been examined and found to be Anonyx nugax. Copy seen: DA.

47966. SHOEMAKER, CLARENCE RAYMOND, 1874–1958. The stegocephalid and ampeliscid amphipod crustaceans of Newfoundland, Nova Scotia and New Brunswick in the United States National Museum. (U. S. National Museum. Proceedings, Oct. 16, 1931. v. 79, art. 22, no. 2888, p. 1–18, 6 illus.) Includes at least five species extending to Labrador Sea and West Greenland waters.

Copy seen: DLC.

47967. SHOEMAKER, CLARENCE RAYMOND, 1874–1958. Three new species of amphipod genus Ampithoe from the west coast of America. (Washington Academy of Sciences. Journal, Jan. 15, 1938. v. 28, no. 1, p. 15–25, 4 illus.)

Includes descriptions of A. dalli and A. rubricatoides n. spp. native to Bering Sea and Aleutian waters.

Copy seen: DLC.

47968. SHTABOVA, A. I. Osnovnye tipy sinopticheskikh professov DVK i ikh povtoraemost'. (In: Khromov, S. P. Sinopticheskie professy Dal'nego Vostoka, 1940. p. 179–97, 16 maps.) Text in Russian. Title tr.: Basic types of synoptic situations in the Far Eastern region and their recurrence.

Contains description of typical synoptic processes divided into western, northern, eastern and southern types. The western type is characterized by latitudinal expansion of the baric fields and by western direction of air currents; the northern, by meridional shift of air masses. Basic cyclonic fields are located in the basin of the Yenisey and also on the Bering and Okhotsk Seas. The eastern type generally is a summer process. The southern type is related to movements of continental air masses from the south.

Copy seen: DLC.

47969. SHTABOVA, A. I. Sinopticheskafâ kharakteristika fevralfâ-apreliâ po linii Aleksandrovsk-Petropavlovsk. (In: Khromov, S. P. Sinopticheskie profsessy Dal'nego Vostoka, 1940. p. 283–304, 19 maps.) Text in Russian. Title tr.: Synoptic characteristic in February—April on the line between Aleksandrovsk-Petropavlovsk.

Synoptic data recorded during 1932– 35 are studied and plotted with indication of the movements of cyclones and anticyclones on charts for February, March and April. The general trend of the movements of cyclones is indicated from west to east or to the northeast, and of the anticyclones from polar regions through Yakutsk to the Sea of Okhotsk. Numerous paths are analyzed and separated into three groups for indication of the degree of recurrence or general trend of the predominant movements for each month.

Copy seen: DLC.

47970. SHTABOVA, A. I. Sinopticheskie protsessy (osi) kholodnogo polugodifa na Dal'nem Vostoke. (In: Khromov, S. P. Sinopticheskie protsessy Dal'nego Vostoka, 1940. p. 198–226, 22 maps.) Text in Russian. Title tr.: Synoptic processes (axes) of the cold half-year in the Far East.

Meteorological data are analyzed to develop general conclusions and a practical method for long-range forecasting. The origin and behavior (direction and intensity) of the anticyclones is studied as a controlling factor for weather Two basic groups of anticychanges. clones are discussed in reference to place of their formation: arctic anticyclones originated in the Arctic Basin area; and continental anticyclones moving from the The arctic group has: Taymyr, Novosibirsk, Yakutsk ultrapolar axes. The continental group has: mid-Asiatic, Altay, and Mongolian axes.

Copy seen: DLC.

47971. SHTABOVA, A.I. Sinopticheskie usloviiâ vtorzheniiâ arkticheskikh mass vozdukha na Dal'nii Vostok. (In: Khromov, S. P. Sinopticheskie professy Dal'nego Vostoka, 1940. p. 227–82, 40 maps, 6 graphs.) 9 refs. Text in Russian. Title tr.: Synoptic conditions for the invasion of arctic air masses into the Far East.

The invasion of arctic air is analyzed with respect to seasonal changes. Circulation of air and atmospheric processes are characterized either by zonal or trade wind circulation or by monsoon circulation. The Far East is divided into four regions: polar or arctic, mid-Asiatic, Mongolian, and the Sea of Okhotsk. Recorded data on the direction of the invasion for the same month over nine years (1927-35) are plotted on eight maps for different months. The movements of arctic air, indicated by 20 to 35 curves on each map, are directed from the polar region to the Japanese Islands during all months. The invasion of aretie air is grouped into five types: northwestern continental, northeastern continental, northern continental; northwestern maritime, and northeastern maritime. **Copy seen:** DLC.

Text in Russian. Title tr.: Influence of transverse irregularities in ice drift on horizontal circulation in sea water.

Ice drift near shore and in open sea under the influence of wind is analyzed, and its effects on surface and deep sea currents are discussed. Irregularities in drift of ice are traced to variable winds and to friction between ice and shore, between ice and land floes, and between individual ice fields exposed to varying wind velocities. The discussion indicates that variable influence of the Atlantic current on movements in the Arctic Basin is also affected by variation of atmospheric circulation above the Basin.—From SIPRE.

Studies on thermal effects of snow cover in protection of winter crops are reviewed. Variations of soil temperature according to thickness of snow cover in different regions, including Western Siberia, are tabulated and graphically represented. Various methods for regulating climate of the soil by snow retention are described: forest belts, fences, planting of long-stemmed grass, corn, sunflower, building of snow banks, etc.

47982. SHUMSKIĬ, PETR ALEKSAN-DROVICH. O narastanii kristallov l'da na tverdoe osnovanie. (*In:* Voprosy geologii Azii, t. 2, 1955. p. 565–95, diagr.) 22 refs. Text in Russian. *Title tr.:* The growth of ice crystals on a solid surface.

Previous investigations are reviewed, and experiments made in the laboratory of the Institute of Permafrostolgy are described. Ice-crystal growth was studied on smooth and rough surfaces of iron and glass at various speeds of cooling and for various directions of heat emission. Oriented ice sections 0.4-0.8 mm. thick were used in studying crystal structure. Orientation varied with conditions of ice formation and solid base structure. Regularities in the ice-crystal orientation suggest the possibility of graduating them with the temperature of ice formation. The new method would permit the history of permafrost and climate of large areas to be studied with paleogeographic analysis of structural crystallization based on quantitative evaluation of the temperature conditions. 47991. SHVETSOV, PETR FILOMO-NOVICH. O printsipakh ratonirovanifa mnogoletneľ kriolitozony. (In: Akademifa nauk SSSR. Institut merzlotovedenifa. Materialy k osnovam uchenifa o merzlykh zonakh zemnol kory, 1956. vyp. 3, p. 18–39, table.) 15 refs. Text in Russian. Title tr.: Principles for the regional division of perennial cryolithic zone.

Various principles of permafrost division are reviewed, and their applicability to discerning uniform areas is discussed. The division of permafrost ground is usually made in regard to specific elements and to physical, mechanical and chemical processes during freezing, thawing, or temperature variation. The so-called cryolithic-zone characteristics of the maritime belt of the Yana-Indigirka lowlands are described (p. 26) on the basis of data obtained from many drillings in the region. The similarity of meaning of cryological and geological formations is analyzed in relation to inter-mountain depressions such as Él'ga, Markovo, Oymyakon, and is applied also to the Anadyr' volcanic plateau. Characteristics of different geocryological formations are analyzed (table 1, p. 35-36) for the arctic lowland, arctic volcanic and non-volcanic plateaus. Many theoretical and practical problems on geocryology are solved on division of the formation according to composing elements, corresponding to small areas. For example the low formations of northern Yakutia are divided in three stages: valley, river basin, and maritime. The mountainous regions of Verkhoyan and others are also analyzed.

47992. SHVETSOV, PETR FILOMON-OVICH. Proiskhozhdenie i zakonomernosti rasprostranenia podzemnykh l'dov. (Akademia nauk SSSR. Vestnik, Mar. 1956. god 26, no. 3, p. 66-69, illus.) Text in Russian. *Title tr:* Origin and regularity of fossil-ice distribution.

Brief survey of permafrost studies in the U. S. S. R., beginning with P. Lassinius (1725) and Kh. Laptev (1739), to recent investigations of P. A. Shumskil, and others. Theories explaining ground ice as fossilized granular snow field (névé or firn theory: O. Koîsebu, E. Toll, and others) or as veins of frozen ground

water (congelation or vein theory: A. E. Figurin, A. Bunge, and others) are outlined. Special study made by the Institute of Permafrostology during the last six years, when various methods and laboratory experiments were used, established the soundness of the congelation theory. Significance of this theory for geocryological survey and engineering in U. S. S. R., where the area underlain by fossil ice is about 1.5 million sq. km. with max. thickness to 50 m., is stressed; need of further studies of location and evaluation of underground ice masses are noted.

4793. SHVETSOV, PETR FILOMON-OVICH. Vvodnye glavy k osnovam geokriologii. (Akademiâ nauk SSSR. Institut merzlotovedeniâ. Materialy k osnovam ucheniâ o merzlykh zonakh zemnoĭ kory, vyp. 1.) Moskva, 1955. 110 p. 4 illus. 61 refs. Text in Russian. Title tr: Introduction to theories on geocryology.

The development of permafrostology in the U.S.S.R. and its basic problems are outlined and existing Russian terminology on the processes of freezing is critically reviewed. Systematization of terminology is suggested, especially for frozen earth crust, frozen ground, soil and rocks. Meaning of the terms permafrost ground, glacial ground, ground, sub-ground, soil, sub-soil, etc. are analyzed and defined as action process or states, on the basis of authoritative interpretations. The term frozen ground is recommended for soil in which the change from water to ice occurs com-pletely or in part. The term frost soil is suggested for rocks and soils containing only bound water below the freezing point. Terms cryosphere and cryolithozone are discussed in detail as processes associated with frost action in the earth. These terms are diagramatically coordinated with sciences on chart, p. 25: geophysics, geocryology, geology are related to climatology, glaciology, hydrology, etc., also to agro-biological and engineering sciences. The second chapter (p. 27-74) reviews progressive studies of the cryolithozone leading to development of geocryology.

Statements and definitions of various phenomena observed by different explorers and scientists are cited. Third chapter (p. 75–107) contains theoretical analysis of the cryolithozone and analyti-

cal formulation of thermal processes between the lithosphere and ground. **Copy seen:** DLC.

47997. SIDENKO, P. D. O nekotorykh poníatiíakh v merzlotovedenii. (Akademiía nauk SSSR. Institut merzlotovedeniía. Materialy k osnovam ucheniía o merzlykh zonakh zemnoľ kory, 1955. vyp. 2, p. 57–58.) 2 refs. Text in Russian. *Title tr.:* On certain concepts of permafrostology.

"Sumgin's definition of permafrost as the soil strata beneath the surface in which a temperature below 0° C. has existed continously from two to tens of thousands of years is considered to be incomplete and inaccurate. Sumgin is criticized for neglecting the state of water aggregation in describing the general physical and mechanical properties of frozen ground. It is suggested that three zones be distinguished in permafrost: the active layer in which the annual cycle of freezing and thawing occurs, the frozen zone where soil particles remain locked in ice for several years, and the zone permanently below 0° C. without a phase change in ground water."—SIPRE.

48001. SIEVERT, ROLF M. Records of gamma radiation from the ground and beta radiation from radioactive debris in Sweden 1950–1955; part 1. (Tellus, May 1956. v. 8, no. 2, p. 117–26, illus., diagrs., tables, text maps.) 28 refs.

Measurements were made at six stations from 56°-68° N. lat. The results are analyzed, and the apparatus and method of measurement are described. Gamma radiation from the ground is constant with dry weather conditions and with no recent nuclear explosions. This radiation pattern changes with snow on the ground, depending on snow absorption. The total radiation depends on the activity of the top snow layer. Data on gamma radiation during and after snow, the correlation between gamma radiation and snow cover in the 1950-51 winter, and absorption by various depths are Copy seen: DLC. graphed.

Mathematica-physica, 26.) 13 refs. Text in German. Title tr.: Some conclusions regarding the registration of precipitation in Finland.

Precipitation measurement from a number of stations, including Sodankylä, is analyzed. Frequency, duration, and amount relationships at individual stations should be studied for better understanding of rainfall effectiveness in individual locations; both practical and climatological purposes would be served.

Copy seen: DGS.

**48007.** SIMOJOKI, HEIKKI JUHANI, **1906**— . On river level rising in springtime as caused by ice jams. (Geophysica, 1952. v. 5, no. 1, p. 1–10, diagrs., map, 5 tables.) 4 refs.

Snow melting in spring raises the level of rivers, ice loosens from the river banks and begins to move. The average dates of the beginning and ending of spring break-up are tabulated for 13 locations on the Kemijoki, and seven other rivers flowing into the Gulf of Bothnia. The time between the two dates varies from 2 to 13 days. The time lapse between the average date of the spring isotherm and the average date of the beginning of spring break-up varies from 8 to 16 days, the corresponding difference for large lakes being about 25 days. An abrupt rise of water level occurs before the beginning of the break-up. Irregularities attributed to ice jams occur during breakup. Regularity in variation resumes after the end of break-up. Two methods of determining the amount of level fluctuation due to ice jamming are presented. Results of estimated amount of jamming by both methods are tabulated. It is estimated that about 20-60 percent of the maximum water-level rise during spring is due to ice jams.—From SIPRE.

48008. SIMON, H. P. Transportation Corps in the field of mobility. (*In:* U. S. Office of Ordnance Research. Interservice Vehicle Mobility Symposium, 18–20 Apr. 1955. v. 2, Papers, p. 10–13, 4 illus., diagrs.)

Development research of the Transportation Corps is outlined briefly. Mobility, as defined by the interests of the Corps, is the maximum effective ton/mile rate of a vehicle when moving through a given terrain. The problem of movement over permanent snow areas led to the development of the "Sno-Train", a 4-unit, multiple trailer vehicle. Power is diesel electric, and all wheels are powered by electric motors. Overall length is 174 ft. with a rated payload of 90,000 lb. Copy seen: DLC.

48009. SIMONEN, AHTI JOUKO PÄIVIÖ, 1916—. Cambrian sediments in Finland. (In: International Geological Congress. 20th, Mexico City, 1956. El sistema Cámbrico, su paleogeografía y el problema de su base: symposium. tomo 1, p. 91–95, text map, table.) 8 refs.

The few Cambrian occurrences in Finland include outcrops on the southwest coast, central Finland, and westernmost arm of Finnish Lapland (approx. 69° N. 21° W.). In Lapland, autochthonous Cambrian sediments deposited on the Precambrian crystalline basement occur beneath the Caledonian overthrust The basal formation contains conglomerate and sandstone. In the upper, containing shale, quartzite and dolomite, evidence of tectonic movements is seen. Manner of occurrence, stratigraphic and lithologic features are similar to those of the fossiliferous Lower Cambrian Hyolithus zone of Sweden and Norway. Copy seen: DGS.

48010. SIMONEN, AHTI JOUKO PÄIVIÖ, 1916– . Finlande. (In: International Geological Congress. 20th, Mexico City, 1956. Lexique stratigraphique international. v. 1, Europe, fasc. 2b, p. 89–101, text map.) 35 refs.

An alphabetical listing of formations in Finland (including northern Finland), giving source of original description and name of each formation, its composition,

age, type locality, geographic distribution, fossils; literature. Generalized geologic map accompanies text.

Copy seen: DGS.

SIMONEN, AHTI JOUKO PÄIVIÖ, 1916–, see also Ödman, O. H. R., and others. Den svensk-finska geologiska exkursionen i Tornedalen . . . 1948. 1949. No. 47136.

48011. SIMONSEN, POUL. Beinredskaper fra Finnmark. (Ottar, Tromsø, Feb. 1955. nr. 3, p. 12–13, illus.) Text in Norwegian. *Title tr.:* Bone implements from Finmark.

Bone implements identical in style but different in age have been found in northern Norway: some 4,000 years old at sites in Nesseby, Båtsfjord, and Kvalsund; some 1,600 years at Kirkenes, and others 400-600 years at Vadsø and on Vardøya.

\*\*Copy seen: DLC.\*\*

48012. SIMONSEN, POUL. "Black houses" in North Norway in the Middle Ages. (Bergen, Norway. Universitetet. Årbok 1955, pub. 1956. Historisk-antikvarisk rekke, nr. 1, Annen viking kongress, Bergen, 1953. p. 100–106,

2 illus., text map.)

The "black houses" (long-houses of stones and turf, with turf roof) seem indigenous to the west and northwest coasts. Sites were investigated by the writer for three seasons (1951-1953?) on Mjelvik, an island on the outer coast northwest of Tromsø. His object was to show close relationship between architecture of the Lofoten-Vesterålen-Tromsø area and that of settlements in Iceland, the Faeroes, and Greenland in the Middle Houses on Mjelvik originated between 1300 and 1450. Two farms, one completely and the other partially excavated, are described, including the dwelling house, cow-byre, fire house, and sheepcot. Copy seen: DLC.

48013. SIMONSEN, POUL. De eldste krigsvåpen. (Ottar, Tromsø, Mar. 1955. nr. 4, p. 20–22, illus.) Text in Norwegian. Title tr.: The oldest war weapons.

The stone axehead here described belonged to the nomadic stock that plundered Europe in pre-Christian times. These weapons were not used in northern Norway, but one has been found at Hungeren in Tromsdalen and another at Småslett on Kvaløya.

Copy seen: DLC.

48014. SIMONSEN, POUL. Helleristninger i Finnmark. (Ottar, Tromsø, Dec. 1955. nr. 7, p. 12-14, illus.) Text in Norwegian. *Title tr.:* Rock carvings in Finnmark.

Two carvings are described: one, at Leirbukt in Repparfjord, depicts two reindeer, an elk, and a skin boat; the other, of flying birds and two boats, was found near Gåshopen on Sørøy, and it resembles more southerly carvings.

Copy seen: DLC.

48015. SIMONSEN, POUL. Helleristninger ved Tromsø. Tromsø, Aug. 1955. 30 p. 8 illus., text map (Ottar, nr. 5.) 4 refs. Text in Norwegian. Title tr.: Rock carvings near Tromsø.

Eleven stone age rock carvings are found in Nordland, eight in Troms, and three in Finmark. In age they range over some 2,000 years. The older are naturalistic, the younger more stylized. All were probably painted with red ochre, but only one now has original paint remnants. The sites at Skavberg, Åsli, Tennes, and Kirkely near Tromsø are described in detail.

"The probable and practical extremes of seven natural environmental stress factors, determined from analysis of available world-wide climatic and environmental data, are explained in detail. Conditions are proposed for the design and evaluation of military equipment intended for use under extremes of temperature, humidity, precipitation (including snow load), wind, penetration and abrasion (by sand, snow, and dust), salt spray, and atmospheric pressure. Operation is characterized as ground and shipboard; the former is subdivided into world-wide, arctic winter, hot desert, and moist tropics. Applicability of the proposed conditions to these types of operation is indicated; world-wide storage is also considered. These data are intended to aid in developing laboratory test methods, but final testing in areas where the extremes are likely to exist is recommended."—TIP.

Suggests plans for utilization of the water reservoirs to be created by the hydro-electric installations on the Angara River: acclimatization of muskrat, organization of hunting, growing of wild Copy seen: DLC. rice, etc.

48037. SKALON, V. N. Olennye kamni Mongolii i problema proiskhozholenevodstva. (Sovetskafa kheologifa, 1956. v. 25, p. 87-105.) 84 Title tr: Pic-Text in Russian. torial reindeer stones of Mongolia and the problem of the origin of reindeer

husbandry.

Discusses various theories of the origin of reindeer husbandry and refutes the notion that domestication of reindeer is endemic to the North. Modern wild reindeer cannot be successfully tamed and even cross-breeding with the domestic stock is usually avoided. Domestic strains come from a now extinct taiga reindeer that used to inhabit the then moister Sayan and West Mongolian-South Siberian area. This theory, supported by archeological finds, shows that the domestic reindeer spread across the Ob' - Yenisey divide, first northwest then northeast, reaching the Lapps in the 9th-11th centuries, the Samoyeds, Tungus and Chukchis probably as late as the 17th-18th. SKARLAND, IVAR, 1899-48038. The Bering land-bridge re-evaluated. (Alaskan Science Conference . . . 1952, Proceedings, pub. 1954, p. 125-27.) 11 refs.

Migration of Pleistocene animals between the Old and New Worlds and the occurrence of remnants of this fauna in lands now occupying insular positions is noted. Literature on worldwide lowering of sea level during glacial stages is reviewed. Low sea levels and wide continental shelves facilitated eastward migrations in the early Pleistocene from the Okhotsk region, and later over a wide Kamchatka-arctic continental shelf. Kotzebue Land is proposed as name of this northern continental shelf. Possibility of animals or men crossing Bering Strait on sea ice or small boats is discounted. Copy seen: DGS.

SKARLAND, IVAR, 1899-48039. Review of early Alaskan prehistory. (In: Alaskan Science Conference . 1953. Proceedings, pub. 1956, p. 197-200.) 11 refs.

No definite proof exists that man was a contemporary of extinct late Pleistocene fauna in Alaska. Man-made flint implements discovered in interior Alaska, on the Arctic Slope, and Norton Sound provide indirect evidence. These discoveries and the literature on them are briefly reviewed. Man must have arrived over the Bering land bridge during the Pleistocene. Two routes to the interior of the continent existed: eastward via the Kuskokwim and Yukon valleys or northeast over the Arctic Slope.

48040. SKELTON, RALEIGH ASHLIN. Explorers' maps, XII; North America from sea to sea, 1600-1800. (Geographical magazine, Feb. 1956. v. 28, no. 10, p. 489-501, illus., text maps.) Continuation of a series represented in Arctic Bibliography by No. 32087-32088

Contains maps with explanatory text on English, French, and Spanish exploration on the North American mainland during the 17th and 18th centuries. Arctic or subarctic areas are shown on Champlain's map of New France, pub. 1632, which includes Labrador and the Hudson Bay region; and Buache's map of the regions explored by La Vérendrye and sons 1731-1749, including the western coastal regions of Hudson Bay. Overland journeys by Hearne (1771) and Mackenzie (1789) and voyages of Cook (1778) and Vancouver (1792-1794) along the Pacific Coast, are depicted (fig. 15) to explode "the myth of a water-passage across Canada from the Pacific to Hudson Bav." 48056. SLATER, J. M. Choice of coordinate systems in inertial navigation. (Navigation, June 1956. v. 5, no. 2, p. 58-62, diagrs.) 7 refs.

Methods of inertial navigation are discussed particularly the choice of the system of coordinates. This problem is of importance in polar navigation since the conventional latitude-longitude system has certain disadvantages associated with the rapid convergence of meridians in high latitudes. The inertial navigator described reduces problems associated with polar flying since it requires no compass and the coordinate system can be

chosen so that its pole can be offset and not coincide with the earth's pole.

Fakul'tet narodov Severa, vyp. 1, p. 141–214.) Text in Russian. *Title tr.:* The economy of Siberia and beginning of navigation to Siberia through the Kara Sea in the period of the development of capitalism in Russia.

Outlines economic conditions in Siberia at the time of the abolition of serfdom in Russia (1861), and development in the 19th and first decades of the 20th century. The conflicting interests of various groups of Russian landowners, merchants and industrialists are indicated, and their attitude to the importation of foreign goods into Siberia by the Northern Sea Route duty free. First attempts at commercial voyages to the Ob' and Yenisey are sketched. Fluctuations of governmental policy and legislation, and the influence of the Siberian members of the State Duma are traced. The role of foreign investments in Siberia and in financing navigation of the Northern Sea Route is considered. World War II has had a favorable influence on development of the Northern Sea Route. This paper, based on published and unpublished materials, was delivered to the Northern Conference at Leningrad University, Dec. 10-14, 1947.

R. as one of the northern regions of the Asiatic part of the U. S. S. R.

Summary of the author's chapter in a collective monograph prepared (but not yet published) by Yakut Expedition of the Academy of Sciences' Institute of Economics. The economic development and progress in industrializing Yakutia are outlined; limitations imposed by climatic conditions, lack of transportation and scarcity of population are stressed. The region is rich in natural resources: iron ore, coal, rare minerals, salt, forests, etc.; but their exploitation costs on the average 1.5-2 times that in regions with more favorable conditions. These resources therefore can be utilized only selectively and locally, as e. g., scarce or rare minerals, Olekminsk salt, Aldan iron ores and coal, etc. Prospects of further development are discussed, stressing the influence of the Northern Sea Route and of Tayshet - Ust'-Kut railroad

Opredelenie modulfa deformatšii gruntov, 1955. p. 42–58, illus., graphs, tables.) Text in Russian. Title tr.: Rated value of modulus of deformation in ground beds for concrete road surfaces.

The importance of the modulus of deformation in the design of roads, airfield runways and courts within the industrial installations, is discussed including theoretical considerations and practical examples. The value of modulus must reflect the complex of natural conditions of the given area (geological, hydrological, climatic and soil conditions), especially the type of deformation under actual load. This value affects the thickness and type of surface and its longevity in service. Field tests on local soils are essential and the test method is described in detail, including tabulated values for different types of soil. Variations of the modulus for wet, frozen and thawed grounds are analyzed. Determination of the rated value of the modulus of deformation of ground beds and different surface layers is explained on the basis of experimental values for different soils and degrees of wetness. Moduli of elasticity and deformation for rapidly applied loads of moving vehicles can be computed from data obtained for slowly increasing loads. Copy seen: DLC.

**48073.** SMIRNOV, G. F. Obogashchenie titanita (sfena). (*In:* Khibinskie apatity, 1933. t. 6, p. 160–63.) Text in Russian. *Title tr.:* Concentration of titanite (sphene).

Ore processing from the Kukisvumchorr deposits is described, with indication of difficulties in increasing concentration suitable for lacquer industry production. Sixty percent titanium extraction is obtained from concentrate of 32 percent TiO<sub>3</sub>. Processed ore contains 35 percent sphene, 35 percent nepheline, and the balance apatite. The magnetic and flotation methods are used for recovery from the concentrates. Copy seen: DGS.

Contains information on the nature and physiology of hibernation and awakening from it; hypothermia in hibernators and in other mammals; in the newborn; deep hypothermia and resuscitation from it; freezing of cells; supercooled and frozen mammals and their recovery.

Copy seen: DNLM.

48080. SMITH, AUDREY URSULA. Studies on golden hamsters during cooling to and rewarming from body temperatures below 0° C. 1; observations during chilling, freezing and supercooling. (Royal Society of London. Proceedings, ser. B., 1956. v. 145, no. 920, p. 391–407, illus., tables.) 36 refs.

A study of 300 animals, made hypothermic in stages, to a core temperature of -5° or -6° C. Temperature fall in the colon, thorax, brain, muscle, etc.; electrocardiograms; heart beat; respiration; spontaneous movements; muscle tone; etc.; as well as incidence of freezing and supercooling were recorded.

Copy seen: DNLM.

48081. SMITH, AUDREY URSULA. Studies on golden hamsters during cooling to and rewarming from body temperatures below 0° C. 2; observations during and after resuscitation. (Royal Society of London. Proceedings, ser. B, 1956. v. 145, no. 920, p. 407–426, illus., tables.) 13 refs.

Account of resuscitation of hypothermic animals which have been "for many minutes or hours" without respiration or circulation, and some frozen for 50 minutes or more to  $-5^{\circ}$  C. Of rewarming methods applied, diathermy proved the most effective; the duration of suspended animation and of freezing also influenced the course and proportion of survival, animals which have supercooled, reviving to live for many weeks or months. Also a great proportion of animals which froze progressively, up to 50 minutes "survived indefinitely." Frostbite and eye injuries were rare and no changes in behavior were noticed 100-450 days after Copy seen: DNLM. resuscitation.

Experimental cold weather clothing designed for use in northern Canada was tested under the wet, cold conditions of southern Norway at Tisleia Fjord from Feb. 21-Mar. 5, 1950. Comments on the efficiency and suggestions for improvement are given for each item. Survival equipment and rations were also tested. Improvised shelters were constructed including a parachute tent and an igloo. Landings were made with Mosquito fighter planes on ice and snow runways under cross-wind conditions up to 30 knots from 40° and a Cornell aircraft was flown on skis. Results indicate that acclimatized personnel are necessary for successful flying and maintenance operations in the Arctic. Copy seen: AMAU.

**48085. SMITH, H. W.,** and **W. R. BULL.** Uranium ore research. (Canadian mining journal, June 1956. v. 77, no. 6, p. 127–30, 159–60.) 3 refs.

Includes (p. 127-28) description of process research initiated by the Canadian Dept. of Mines in 1945 to improve the overall recovery of the mill at the Port Radium mine of Eldorado Mining & Refining Ltd., Great Bear Lake. Results of physical concentration work indicated a chemical treatment necessary to get maximum recovery from ore and salvage uranium in stored tailings. Development of acid leach and precipitation processes is described. Eldorado built a ten ton/day pilot to treat the gravity mill tailings.

SMITH, HARRIET G. BROWN, 1923- , see Wallace, J. H., and H. G. B. Smith. Bibliography . . . trace elements . . . 1955. No. 48841.

48086. SMITH, HARRY BUCHANAN. The use of polar ice in inter-hemispheric

air operations. Washington, D. C., June 1956. vii, 238 l. illus., diagrs., tables, text maps. Typescript. (Dissertation submitted to Georgetown University for the degree of Master of Arts.) Approx. 100 refs.

Contains a strategic analysis of the Arctic based on the so-called Polar Concept, which postulates that in a major war of the foreseeable future, air strikes will transit the Arctic Basin, air and missiles defenses must be based in the Arctic, hence the belligerents must have the capability of carrying out military operations under conditions peculiar to the Arctic. Meteorological, geographical, and physical factors peculiar to the area are reviewed, including the history, formation, and characteristics of ice islands. North American Arctic flying, weather stations, maintenance and navigation problems, and some transpolar flights are sketched. Soviet Arctic flying and major expeditions from Drifting Station North Pole 1 to 1954 are reviewed. The logistic support of military forces operating on or from the Arctic Ocean ice is examined, and observations are made on how sites may be selected and construction carried out. Legal questions with respect to sovereignty in the Arctic, which must be understood in connection with a program of construction of air sites, are studied. Conclusion is drawn among others, that vast areas of ice upon which to construct light airstrips are available throughout the Arctic Basin; useful and effective small units can be designed, formed, deployed, and supplied in almost innumerable locations throughout the Arctic for such purposes as radar, weather, and navigational aid stations; emergency strips for long range bombers; base sites for limited numbers of long-range penetration fighters or reconnaissance aircraft; mid-course guidance stations for intercontinental missiles.

48087. SMITH, J. Some moving soils in Spitsbergen. (Journal of soil science, Jan. 1956. v. 7, no. 1, p. 10-21, diagrs., table, text map, plate.) 16 refs.

Report of a reconnaissance soil survey carried out by the Aberdeen Spitsbergen Expedition, headed by Dr. E. A. Fitzpatrick in July-Aug. 1954, with base at Moskushamn. It covered an area of 160 sq. km. Studies were made of the structure and composition of structural soils and ground ice. Factors active in

soil formation and movement are examined, and resulting forms are described, including rock outcrops, scree, striped soils, solifluction soils, polygons, peat, and other soil catenas. Each surface marking characterizes a given site and can therefore be used to identify the soil profile beneath. Each form is thought to be derived from that occurring higher upslope. The quantity of ice in permafrost depends on the texture and water content of the active layer and varies from 85 percent in silty clay to 10 percent in frozen sand. Greatest active layer depth was 130 cm. in striped soil, compared to 35 cm. in coarse rock debris. The soil forms observed are classified according to Kellogg and Nygard (cf. No. 23182), and Kubiens. Copy seen: DLC.

48088. SMITH, JAMES H. Engineering science and the public. (*In:* Alaskan Science Conference . . . 1953. Proceedings, *pub.* 1956, p. 67–68.)

Stresses leadership in engineers' role in society. Copy seen: DGS.

48089. SMITH, JOHN BERNHARD, 1858-1912. Contribution toward a monograph of the insects of the lepidopterous family Noctuidae, of temperate North America. Revision of the species of the genus Agrotis. Washington, D. C., U. S. Govt. Print. Off. 1890. iv, 237 p. 5 plates. (U. S. National Museum. Bulletin, no. 38.)

Contains discussion and a synopsis of the genus and its groups, synopses of the species, and a systematic list of about 300 species and varieties, of which 16 are new. Synonyms, descriptions, measurements and data on habitat and distribution are given, and 17 of the species are recorded in Alaska, northern Canada and Greenland.

Occurrence of uranium and thorium is described generally, also methods of locating them. Finds of radioactive minerals in Greenland are small so far and of no commercial value.

Copy seen: DLC.

48104. SØRENSEN, HENNING. Xonotlit fra Grønland. (Dansk geologisk forening. Meddelelser, Jan. 1956. bd. 13, hefte 2, p. 85-86, table.) 3 refs. Text in Danish. Summary in English. Also pub. as: Greenland. Geologiske undersøgelse. Miscellaneous paper, no. 15. Title tr.: Xonotlite from Greenland.

From Nugssuaq, 70°25′ N. 52°30′ W., in West Greenland, Rink (No. 14611) mentioned an asbestos-like okenite occurring in fractures in the much altered basalt. The mineral was found to be wollastonite; but the optical properties,

do not agree very well with those of other wollastonites, since all fibers have positive elongation. The powder X-ray diffraction pattern of the mineral showed it to be xonotlite. **Copy seen:** DGS.

48106. SOKOLOV, A. A. Gidrografia SSSR, vody sushi. Leningrad, Gidrometeorologicheskoe izd-vo, 1952. 471 p. illus., tables, graphs, maps incl. fold. 69 refs. Text in Russian. *Title tr.*: Hydrography of the U. S. S. R., land waters.

Text book approved by the Main Administration of Hydrometeorological Services of the U.S. S. R. for hydrometeoro-

logical colleges. Introductory chapters (p. 11-56) review the study of waters of the U.S.S.R. and development of the hydrographic net. Fundamentals of the river net, lakes and reservoirs, marshes, contemporary glaciers, and permafrost, are presented in successive chapters (p. 56-113). Basic data of river systems including those of the North, are given in tables 5-6 and charts 11-13. Water balance and hydrological zones of the U.S.S.R., water, thermal and ice regimes of rivers, etc., are dealt with (p. 113-88). The main natural regions of the U.S.S.R. are treated in turn, including Karelia and Kola Peninsula (p. 189-207), northern European U. S. S. R. (p. 207-245), western and eastern Siberia (p. 379-445) and Kamchatka (p. 460-63). For each region, the climate, terrain, general hydrology, the main river systems and lakes are characterized, with basic (though not, usually, recent) data graphed and tabulated. Copy seen: DLC.

48107. SOKOLOV, ALEKSANDR ALEKSEVICH. Osnovnye polozhenia poverkhnostno-posloinogo sposoba dobychi kuskovogo torfa s pomoshch'ū člektrifitsirovannogo samokhodnogo torfanogo kombaina, ÉSTK. (Akademia navuk BSSR, Minsk. Instytut torfa. Trudy, 1955. t. 4, p. 91–95, table.) Text in Russian. Title tr.: Basic conditions for the surface-layer method of excavating peat pieces by means of the electrified self-operating peat combine, ESTK.

A new method for excavation of successive surface layers of peat (cf. No. 45188) is discussed, stressing moisture condition (76-82 percent) permissible for formation and safe handling of peat products during the additional drying All intermediate processes required for production of final peat shapes are incorporated in one automatic combine-machine. It excavates, cuts, crushes, mixes, compresses and forms the continuously flowing mass (with a warmpress), cuts it into bricks or cylinders, arranges them on the ground for final Physical characteristics of the combine and the rates of production are tabulated. Copy seen: DLC.

SOKOLOV, ALEKSANDR ALEKSEE-VICH, see also Bezzubov, N. D., and A. A. Sokolov. Dobycha kuskovogo torfa mashinoĭ MPDK. 1955. No. 44019.

Sketches of wildlife on Taymyr Peninsula, as observed early in the spring: arrival of such migratory birds as snowbunting, geese, gulls, etc.; abundance of game; rapaciousness of the skuas; arctic flora in early spring. Copy seen: DLC.

48112. SOKOLOVA, M. N. O zakonomernostíákh raspredeleniía glubokovodnogo bentosa; vlifánie makrorel'efa i raspredeleniía vzvesi na pishchevye gruppirovki donnykh bespozvonochnykh. (Akademiía nauk SSSR. Doklady, Oct. I, 1956. t. 110, no. 4, p. 692–95, illus., tables.) 3 refs. Text in Russian. Title tr.: Regularities in distribution of deepsea benthos; the influence of the distribution of suspended material on the food grouping of bottom invertebrates.

Three groups are distinguished among the bottom invertebrates, according to the kind of food they ingest; and their depth distribution in the northwest Pacific and Bering Sea is outlined. The role of the bottom relief as determinant of currents and the significance of suspended food-material as ultimate source of nutrition for the bottom invertebrates, are also discussed. Based on study of the digestive tract of 1923 specimens (83 species) taken by the research vesses taken by the research vesses (Kuril-Kamehatka, and Aleutian Trench, Bering Sea, etc. Copy seen: DLC.

48113. SOKOLOVA, M. N. Pitanie glubokovodnogo bentosa: pitanie Laetmatonice producta v. wyvillei McIntosh. (Akademiâ nauk SSSR. Doklady, Oct. 21, 1956. t. 110, no. 6, p. 111–14.) 5 refs. Text in Russian. Title tr.: The food of deep-water benthos: the food of Laetmatonice producta v. wyvillei McIntosh.

This carnivorous polychaete was collected by the research vessel Vitiaz' in the Kuril-Kamchatka trench at 3800-4130 The intestinal contents of 30 specimens was: 40 percent Crustacea Amphipoda, 20 Polychaeta (fam. Flabelligeridae), and bottom deposit particles 40. Two other polychaetes of the same family (Polynoidae), Eunoe nodosa and Harmothoe rarispona from the sublittoral zone of Bering Sea (at 87 m. depth) were also investigated. The content of their intestines was Crustacea Decapoda 41 percent; Polychaeta 12; bottom sediments 47. Bottom particles are taken incidentally to the feeding process. The real food consists chiefly of Amphipoda in the abyssal zone and Decapoda in sublittoral.

48116. SOLEM, ARNE, Editor. Norske kraftverker, utgitt av Teknisk ukeblad ved dets 100 års jubileum april 1954. Oslo, Teknisk ukeblads forlag, 1954. 440 p. illus., maps, diagrs. Text in Norwegian. Title tr.: Norwegian powerplants, published by Teknisk ukeblad (Technical weekly) at its 100-year jubilee, April 1954.

Hydro-electric plants of the arctic provinces of Norway are included in the alphabetic index (p. 9), the drainage basin index (p. 10-11) and on maps of power plant locations and runoff (p. 13, 15). The electric network of northern Norway is described p. 45–58. Discussion of installations (p. 379-440) in Nordland, Troms, and Finmark include size of drainage basin, reservoir storage capacity, size and construction of power plant, photographs, diagrams of some installations, maps large enough to illustrate hydrological details, and plans for future developments. 48120. SOMOV, MIKHAIL MIKHAĬ-LOVICH. The drift of the scientific research station of 1950–1951. Washington, D. C., 1956. 27 p. 13 illus, fold. map. (In: Somov, M. M. Observa-

tional data . . . drifting station 1950-1951, pt. 1; translated by David Kraus.)

A general review is given of the establishment, and maintenance of the Soviet drifting station North Pole-2, including construction of landing strip and road, air-drop of supplies, etc. Fire hazard and meltwater in the station, shifting and breaking of the ice floe in winter, were the most serious problems during the drift. The station, established at 76°10' N. 193° E. on Apr. 1, 1950, and maintained for 376 days, drifted a complex path covering 2600 km., but only 635 km. straight-line distance. Map of the drift, list of personnel and illus. of the camp are given. The scientific results, preliminary in nature, are summarized here and reported separately as listed in No. 48121. Continued drift of the ice floe (map), and its aspect when sighted from aircraft in 1954 are noted.

Copy seen: CaMAI.

48121. SOMOV, MIKHAIL MIKHAĬ-LOVICH, Editor. Observational data of the scientific-research drifting station of 1950-1951, vols. I-III. Materialy nablfüdenil nauchno-issledovatel'skol drelfufushchel stantsii 1950/51 goda, red. M. M. Somov, Leningrad, Izd. 'Morskol transport' 1954-1955. Translated by the American Meteorological Society under contract AF 19(604)-1936, with support and sponsorship of the Geophysics Research Directorate, Air Force Cambridge Research Center, Air Research Washingand Development Command. ton, D. C., U. S. Dept. of Commerce, Office of Technical Services, 1956. 9 pt. diagrs., illus., maps, tables. (ASTIA Document 117132-117140).

Contains 17 papers translated by David Kraus and (the first three oceanographic papers) by E. R. Hope, together with data tables and illus. photo-reproduced from the Russian edition. Translation was made from a set of the Russian volumes (I-III) at National Academy of Sciences, U. S. National Committee for the International Geophysical Year, Washington, D. C.; another set is at Scott Polar Research Institute, Cambridge, Eng. Volume IV of the Russian edition, on solar radiation, geomagnetism, gravity, and auroras is not included.

The drifting station North Pole-2 was established by the Arctic Institute U. S. S. R. on ice in the Arctic Basin north of Bering Strait, in the so-called Region of Relative Inaccessibility.

Headed by M. M. Somov, a party of 16 (later 11) carried out oceanographic, ice, meteorological, actinometric, geomagnetic, pendulum, and auroral observations in the course of the drift, Apr. 2 1950-Apr. 11, 1951. The data worked up at the Institute by/with station personnel are presented in tables with short explanatory text (mostly) by the observer. Each paper is described in this Bibliography under the scientist's name.

The area from Loppafjord northward to the mouth of Porsangerfjord east of Nordkap is described, and conditions (oxygen, salinity, temperature) at various depths are discussed. The spring fisheries in the area and conditions in the fishing places are reviewed. Data tables show depth, temperature, salinity, oxygen content and saturation, phosphate and pH content, etc., for various stations. This report, originally prepared (in Norwegian) before World War II, was lost until several years after the war.

The phenomenon discovered in 1918 by Prof. R. F. Griggs "may find explanation in the 'velocity cooling' which is known to occur in a jet of gas issuing from an orifice . . . The cooling effect is due to the conversion of heat energy into translational kinetic energy, which is consequently converted back into heat when the high-velocity jet of steam is checked."

Pleistocene clay samples (102, six from areas north of the Arctic Circle.) were investigated and detailed studies made on the 12 most typical (one from 66°32′ N. 25°53′ Rovaniemi. Methods consisted of X-ray diffraction, differential thermal analysis, and electron micrography. Results showed that biotite and chlorite in the original material (Precambrian igneous and metamorphic rocks) have produced trioctahedral illite and clay chlorite. Two vermiculite types and mixed-layer minerals are common constituents. Amount of non-clay minerals depends on particle size and rate of sedimentation of the clays. Extent of leaching in and petrography of the original material affected the clay composition .-From author's abstract.

48138. SPÄRCK, RAGNAR, 1896—. Descendensteoriens stilling i nutidens zoologi. (Naturens verden, København, 1948. årg 32, p. 14–35, 9 diagrs., 2 graphs.) Text in Danish. *Title tr.:* The position of the theory of descendance in modern zoology.

Includes in a discussion of geographic variation of species, reference to longer wing span of northern puffins (Fratercula arctica and F. naumanni) over southern races, and graphical comparison of wing span of forms from boreal, arctic, and high arctic localities.

Copy seen: DLC.

48139. SPÄRCK, RAGNAR, 1896—. Naturfredning i Grønland. (Grønland 1953. hefte 7, p. 262-64, illus.) Text in Danish. *Title tr.:* Nature protection in Greenland.

Advocates passing a game law, establishment of nature reserves and national parks, as well as protection of certain animals for preservation of the species. The only existing nature reserve is Sandgen in Young Sund (74°20′ N. 20°20′ W.) near Daneborg, East Greenland. All geese species in northeast Greenland and the walrus north of Dove Bugt (76°30′ N. 20° W., East Greenland) are protected. There are also certain botanical reserves. Copy seen: DLC.

48140. SPANGENBERG, E. U samogo Belogo morâ. (Okhota i okhotnich'e khoziāistvo, Oct. 1956, no. 10, p. 28–29.) Text in Russian. *Title tr.:* At the White Sea.

Describes the spring resting place of migrating birds in the delta of the Severnaya Dvina River and depletion of their stock, especially of swans, caused by the almost unrestricted hunting. Prohibition of spring hunting in such resting places and other means of conservation are discussed and recommended.

48142. SPENCER, JOSEPH WILLIAM WINTHROP, 1851–1921. Glacial-erosion in Norway and in high latitudes; on the theory of glacial motion. (Royal Society of Canada. Proceedings and Transactions, 1887. v. 5, sect. 4, p. 89–100, diagrs.)

Contains detailed description of investigations made in the summer of 1886 in sub-glacial caverns of three Norwegian glaciers. The results are discussed in relation to glacier motion. The glaciers are advancing rapidly and they do not conform to the surfaces over which they pass but arch over from point to point to form caverns. Various theories of glacier motion are reviewed, and the phenomenon is attributed to the effect of gravity on a visco-elastic body, the motion being greatly modified by temperature. The ability of floating ice to erode is also discussed.

48143. SPENCER, MARIETTA B. The child in the contemporary culture of the Barrow Eskimo. (Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 130–32.)

Aims of child rearing in the older

Barrow culture are described and compared with those of the present. Effects of contact with the white man (schools, movies, hospitals, employment with U. S. armed forces, etc.) are noted. Changes have not so far resulted in disorganized individuals or communities. Many old skills are still taught the children, although grandparents play a lesser part as teachers. Individual freedom is still respected. Some aspects of present child-training are listed.

48144. SPENCER, ROBERT FRANCIS, 1917 - . Forms of cooperation in the culture of the Barrow Eskimo. (Alaskan Science Conference . . 1952. Proceedings, pub. 1954, p. 128-30.) 2 refs.

The Arctic Coast from Pt. Hope to Pt. Barrow is an area of common culture. characterized by sea-mammal hunting, especially whaling. Structure and component elements of the Barrow Eskimo society were studied (summer, 1952) to determine role played by cooperation. Primary instances of cooperative action occurred within the kinship groups and crews of whaling boats. These are briefly discussed. Primary integrative factor in the Barrow society continues to be the bond of kinship in spite of social and economic changes. When changes strike the family structure, societal disorganization may follow.

48145. SPENCER, ROBERT FRANCIS, 1917— Map making of the North Alaskan Eskimo. (Minnesota Academy of Science. Proceedings, 1955. pub. 1956? v. 23, p. 46–49) ref.

Describes maps depicting local terrain, used by the Eskimos for travel directions; "drawn" in sand or snow, they indicated surface features of the tundra, and the traveler would commit topography, landmarks, and place names to memory. Such maps were never drawn on skins or other portable material. Trade and travel between coastal and inland groups necessitated maps and instructions for those entering unfamiliar territory. Social

48150. SPIER, LESLIE, 1893—. The prophet dance of the Northwest and its derivatives: the source of the ghost dance. Menasha, Wis., G. Banta, 1935. 74 p. diagr., map. (General series in anthropology no. 1). Approx. 150 refs.

This dance and derived cults, with doctrine of the end and renewal of the world, return of the dead, etc., was distributed among Indian tribes from northern California to north-central British Columbia. Evidence (from early explorers' narratives) that it was transmitted to Athapaskan tribes of the Mackenzie area is examined (p. 25-29): the prophet cult seems to have been transmitted to the Yellowknives and others about 1812; and a century later to be part of a derivative complex among the Beaver, Slave, Dogrib, Satudene Indians. Copy seen: DLC.

48151. SPILSBURY, R. H. and R. L. SCHMIDT. Ecological investigations of coastal forests of British Columbia. (In: Alaskan Science Conference . . 1953. Proceedings, pub. 1956, p. 94–96.)

An outline of forest soil research, commenced in 1941, and of a wider, ecological survey (begun in 1950) of the coastal forests, including stands of all ages and species composition. The findings indicate a great variety of soil, topographic and climatic conditions together with great variations in forest age extending to 3000 years.

48155. SPRINGER, GEORGE DOUG-LAS. Knee Lake area; preliminary notes to accompany geological map 46-1. [Winnipeg, 1946?]. 2 l., fold. map 31 x 41 in. Mimeographed. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Preliminary report, 46-1.)

Map (scale 1 in.: 2 mi.) covers the area 55°-56° N. 94°-95° W. in the Hayes River basin. Area is mantled by heavy drift, and few rock outcrops are found.

Consolidated rocks are Precambrian. Oldest known are the Hayes River group, a volcanic and sedimentary series. Numerous narrow quartz prophyry dikes cut all types of volcanic rock. The major intrusive is a biotite granite varying from massive structureless to gneissic granite. Diabase dikes and quartz veins intrude all these rocks. The drift cover has been a hindrance to prospecting except near the shores of Knee Lake and Hayes River.

48156. SPURR, GERALD B., and others. Temperature gradients in the hypothermic dog. (American journal of physiology, July 1956. v. 186, no. 1, p. 47-51, illus., tables.) 6 refs. Other authors: S. M. Horvath, L. H. Hamilton and B. K. Hutt.

A study of temperature gradient in 15 dogs, with six of them showing a relatively stable hypothermic state of ca. 25° C. for from 4.5–34 hrs. "Initially the greatest amount of heat lost to the environment was from the muscular tissue. As the hypothermia progressed, a greater and greater flow of heat came from the deep, central regions;" the temperature gradient during hypothermia suggests a heat flow primarily through conduction. Values of the "thermal circulation index" in various regions were also studied during hypothermia.

48159. STAGER, J. K. Progress report on the analysis of the characteristics and distribution of pingos east of the Mackenzie delta. (Canadian geographer, 1956. no. 7, p. 13–20, text map, diagr., 2 tables) 4 refs.

The locations and characteristics of 1380 pingos were recorded from study of aerial photographs and visit to the Mackenzie delta in summer 1954. Ninety percent are small to medium in size (to 80 ft. high), most have round outlines, are plug-shaped, with smooth summits. Nearly all are found in lake basins. Three main areas of concentration are found: along the East Channel of the Mackenzie between Tununuk and Kittigazuit, Toker Point to Tuktuk and westward, west side of Richards Island. Copy seen: DLC.

Text in Russian. *Title tr.:* The development history of the hydrographic net in northeastern European U. S. S. R.

Attempt is made to evaluate the geological age of the Pechora River basin and adjoining regions: the pattern of the present-day hydrographic net was established during the last intra-glacial period when the alluvial terraces of various rivers were developed. During the last glaciation, changes in the relief of the region were comparatively small. When the ice sheet receded, the rivers returned to their former valleys and the process of accumulation of new alluvial deposits was resumed.

48163. STANLEY, GLENN M. Anomalous ground wave propagation in the

vicinity of Point Barrow, Alaska. Boulder, Col. 1956. 1 p. (*In:* U. S. National Bureau of Standards. Symposium on the propagation of V. L. F. radio waves, Jan. 23–25, 1957, paper no. 26).

Measurements of effective ground conductivity over the past several years in an area south of Point Barrow showed anomalous conditions. Attenuation of the ground wave by as much as it would be over sea water was found. This might be explained by the presence of a "layered-earth." Brine layers reportedly exist in the area at depths of 10–100 ft. between layers of permafrost.

48168. STARIKOVA, N. D. Organicheskoe veshchestvo v tolshche osadkov Beringova morîa. (Akademiñ nauk SSSR. Doklady, Jan. 21, 1956. t. 106, no. 3, p. 519–22, tables.) 9 refs. Text in Russian. Title tr.: Organic matter at various levels of deposits of the Bering Sea.

Account of investigation of cores 1.0-15.5 m. long taken from various depths to 4000 m. Organic C content varied between 0.57 and 1.76 percent; that of N between 0.06 and 0.22 percent. The amount of organic matter in shallow-water deposits was found to be higher than that in the deep sea.

Copy seen: DLC.

48169. STARIKOVA, N. D. Organicheskoe veshchestvo zhidkol fazy sovremennykh osadkov Okhotskogo morfa. (Akademifa nauk SSSR. Doklady, June 11, 1956. t. 108, no. 5, p. 892-94, tables.) 8 refs. Text in Russian. *Title tr.:* Organic substance of the liquid phase of contemporary sediments in the Sea of Okhotsk.

The presence of organic substances in the bottom sediments was studied earlier in connection with concentration of dispersed liquid hydrocarbons from argillaceous deposits into condensed form. These studies are reviewed in relation to the present investigation of the Sea of Okhotsk sediments. Bucket samples and cores from various depths of the bottom were compressed by a hydraulic press (to 100 kg./cm<sup>2</sup>). The liquid squeezed from the sample and compressed residue material were analyzed for carbon content and results are tabulated for each sampling method. Content of soluble organic carbon is found to be 5 mg./liter for the upper layers and 13 mg./l. 30 cm. lower, and represents only about 0.3 percent of the amount in the solid phase. Carbon content in the liquid phase, however, is about 15 times that in ocean water. Copy seen: DLC.

The results of analyses of lovchorrite, rinkolite, and their surface erosion are discussed. The erosion process is interpreted not as one of disintegration but later mineral formation, on the basis of the microscopic and chemical analyses. Presence of rare earths in 12 samples was found from 1.5 to 12 percent. Chemical analyses of lovchorrite, vudyavrite and kondrikite are given in (four) tables.

48176. STEARNS, STEPHEN RUSSELL, 1915— . Aircraft operations on floating ice sheets. [Hanover, N. H., Dartmouth College, 1956]. 26 l. diagrs. 11 refs. Paper delivered before the Air Transport Division, American Society of Civil Engineers' annual meeting, Pitts-

burg, Pa., Oct. 16, 1956.

"The history of travel over ice is outlined, and a synopsis of available information on the use of floating ice for airfields is given. The mechanical behavior of a floating ice sheet under load and the relationships of various properties of the ice to this behavior are discussed. The theoretical and empirical approaches to the prediction of safe bearing capacities of floating ice are described, and the recommended procedures for the selection of a landing site is given."—SIPRE.

Contains a genealogical study of Lapp families (31) of Kautokeino (68°59′ N. 23°08′ E., north Norway) with consideration also of 31 smaller families connected with the former by marriage. The study is taken from the earliest reliable information (usually first half of the 18th century) through 1950. Short notes on the origins of the families are given as well as etymological information on the names.

48178. STEEN, ADOLF. Kautokeinostudier. Oslo, Norsk folkemuseum, 1956. 113 p. 2 fold. maps, tables (Samiske samlinger, bd. 3) 30 refs. Text in Norwegian. Title tr.: Kautokeino studies.

Contains an historical account of the nomadic Lapps in the Kautokeino district from the mid-16th century with special reference to fishing, hunting and reindeer husbandry. A survey of communities (sii'dâ) is given, families and individuals in each community are listed with indication of where they spend summer and winter. There were 25 communities in summer 1954 with 684 inhabitants. Demographic data (marriage, number of children, longevity) include the settled as well as nomadic Lapps.

Reykjavík, 1956. 23 p., 20 text charts, diagrs., graphs. (Reykjavík. Háskóli Islands. Atvinnudeild. Fiskideild. Fjölrit fiskideildar, nr. 6.) 4 refs. Text in Icelandic. Summary in English.

Hydrographic investigations were made in Denmark Strait-Greenland Sea northeast to Jan Mayen in connection with herring investigations by the research vessel Aegir (Iceland University Research Institute, Dept. of Fisheries). Influx and distribution of Atlantic water, currents, dissolved oxygen and phosphates, temperatures and salinity structures and distribution are described and compared with conditions in 1954 (No. 45828). The phytoplankton was much less abundant than in 1954. The northwest area was ice-free as far as 68° all summer.

48183. STEFANSSON, VILHJALMUR, 1879- . Causes of Eskimo birthrate increase. (Nature, *London*, Nov. 17, 1956. v. 178, no. 4542, p. 1132.)

Discusses the increased birth rate of the (Point Barrow, North Alaska) Eskimos, generally attributed to the adoption of white man's diet. He suggests another explanation: the early weaning of babies instead of old, prolonged breast feeding. This new practice, also adopted from the white populace, would result in more frequent conceptions and births.

A new edition of No. 48186, now enlarged by introductory sections of Dr. Frederick J. Stare, Dr. Paul Dudley White and the author. Text and bibliography are the same as in the first edition.

Copy seen: DLC.

48185. STEFANSSON, VILHJALMUR, 1879— . Natural cold storage. [Washington, D. C.] 1956. iv, 22 p. diagrs. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, no. 13.)

Reviews some of the physical principles

and the historical development of the use of permafrost for cold storage purposes. Account is given of this method as used in Alaska: at Elephant Point by the Lomen Reindeer Co., and at Pt. Barrow by the U. S. Navy (contributed by Carl Lomen, and P. W. Roberts); in arctic Canada: experience at Aklavik, Cape Bathurst, at Baillie Island (by W. P. Johnston), etc.; and in Siberia: at Ust'-Yenisey Port and Igarka (based on No. 3041). Construction methods of storage rooms in the frozen ground are outlined, and typical areas are illustrated. Copy seen: DLC.

48186. STEFANSSON, VILHJALMUR, 1879- Not by bread alone. New York, Macmillan, 1946. xv, 339 p. tables. About 300 refs.

Following introductions by Drs. E. F. DuBois and E. A. Hooton, the author expounds his ideas on arctic diet and meat diet in general, on the basis of his studies and experience with exclusively meat-eating Eskimos, and of the opinions of other explorers and some physiologists. To prove his point that man can live and remain healthy on a pure meat and fat diet, Stefansson and an associate lived for a year on such a regimen, under scientific investigation by the Russell Sage Institute of Pathology, sponsored by the American Meat Institute, an experience fully reported in the book. In addition, the account contains information on Eskimo (and Indian) hunting, fishing and diet; scurvy and antiscorbutics; the preparation and composition of pemmican; pemmican wars; current ideas on pemmican, etc. Copy seen: DLC.

48187. STEFANSSON, VILHJALMUR, 1879— A word common to the natives of Alaska, Canada, Greenland and Brazil. (Nature, London, Nov. 3, 1956. v. 178, no. 4540, p. 1008.)

Discusses the Eskimo 'kutsuk' used from time immemorial for (spruce) gum chewed by the children, for dried seal blood used as its substitute, and more recently for chewing-gum of the white man. A possible common origin with the Brazilian "caoutchoue" is suggested. A similar suggestion is made for the Eskimo word for fire "ignirk" and the Latin equivalent 'ignis.' Copy seen: DNLM.

48188. STEIGER, ANDREW J. Arctic routes to China and the Soviet Union. (Amerasia, June 1942. v. 6, no. 4, p. 166-73, map) 5 refs.

Three alternative supply routes to the Soviet Union from North America are proposed: a great circle air route over the North Pole; a so-called "northern Burma Road" from Edmonton via Fort Nelson and Fairbanks to Teller on Bering Strait; and sea route from Seattle via Dutch Harbor through Bering Strait and along the Northern Sea Route to Arkhangel'sk and Murmansk. Map shows proposed routes. Copy seen: DLC.

48189. STEIN, ERNST, and H. LAM-MERT. Kältereflex und Kreislauf. (Archiv für physikalische Therapie, 1955. Jahrg. 7, Heft 5, p. 377–85, illus.) 29 refs. Text in German. *Title tr.:* Coldreflex and circulation.

Contains a study of cosensual blood-vessel reactions following local cold-stimulus. Increase of arterial, and decrease of venous, peripheral circulation were observed; the latter occurred at temperatures which had no effect yet on the arterial, peripheral circulation. Threshold and intensity of reaction vary from person to person; the effects of preceding cold- or warm-exposure are also discussed.

Copy seen: DNLM.

48190. STEIN, HAROLD JACOB, 1913-, and others. Physiological reactions to cold and their effect on the retention of acclimatization to heat. Natick, Mass., Dec. 1948. 26 p. illus., tables. (U. S. Quartermaster Corps. Environmental Protection Section. Report, no. 142.) 42 refs. Other authors: J. W. Eliot and R. A. Bader.

Account of observations on three healthy, white males, exposed successively to periods of heat, cold and again heat. Cardiovascular and metabolic functions, water and chloride balance and body water partition were recorded. The findings suggest that repeated cold exposures do not accelerate loss of heat acclimatization. There was no evidence for cold acclimatization and no significant

change in basal metabolic rate during the heat or cold periods was observed.

. Geschichte des wogulischen Vokalismus. Berlin, Akademie-Verlag, 1955. is, 366 p. map, diagr., tables (incl. 1 fold.). Approx. 20 refs. Text in German. *Title tr.:* History of Vogul vocalism.

An analysis of the vocalism and vowelgradation of the language and dialects of the Voguls based primarily on the studies of A. Kannisto. The distribution, history, economy, customs, etc., of the Voguls are sketched (p. 1-11), vital statistics for 1905, 1926, 1939 are tabulated, and a schematic diagram of Vogul dialectal relationship given (p. 3). A vocabulary (p. 342-62) and a list of loanwords from Ostyak, Turko-Tatarian, and Russian (p. 362-64) are appended. A phonemic transcription devised by the author and based on Latin and Greek characters is used. Copy seen: DLC.

48193. STEJER, FRANCIS ADRIEN, 1916- . Pyrite deposits at Horseshoe Bay, Latouche Island, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 107-122. 5 maps (1 fold.), table. (U. S. Geological Survey. Bulletin 1024-E. Mineral resources of Alaska.) 6 refs

At Horseshoe Bay, southwest Prince William Sound (60°01' N. 147°57' W.), the sulfide zone was explored in the early 1900's as a copper prospect; current interest is in sulfur. Replacement lenses of massive and disseminated sulfides occur in a mineralized zone in the slate-gray-

wacke. Primary sulfide minerals are pyrite principally, chalcopyrite, cubanite, sphalerite, pyrrhotite, arsenopyrite, and galena. Four claims are described, and spectrographic analyses are given for eight ore samples from one.

STIASNY, GUSTAV, 1877-48206. and H. VAN DER MAADEN. Über Scyphomedusen aus dem Ochotskischen und Kamtschatka Meer nebst einer Kritik der Genera Cyanea und Desmonema. (Zoologische Jahrbücher. Abt. für Systematik, Geographie und Biologie, 1943. Bd. 76, Heft 3, p. 227–66, 15 55 refs. Text in German. Title illus.) tr.: On Scyphomedusae from the Okhotsk and Kamchatka Seas with some criticism of the genera Cyanea and Desmonema.

Contains critical notes on a small collection (20 specimens) of these medusae obtained in 1936 by Prof. K. Derfügin (who died in 1938), together with a hydrographic and faunistic survey of the region. A critical revision follows of 17 species of Cyanea and two of Desmonema. Among them are C. arctica (northern Norway), C. ferruginea (Aleutian waters) and C. postelsii (Aleutian and Sitka waters). Copy seen: DSI.

48207. STICKNEY, PALMER BLAINE, 1915- , and W. J. MUELLER. Effect of cure on low-temperature and aging properties of nitrile rubbers. (Rubber world, May 1956. v. 134, no. 2, p. 234-38, diagrs., ports., tables.)

Experimental details and results are given of an investigation to determine the relative effectiveness of various levels of the vulcanizing agents in conventional sulfur-accelerator and thiuram-disulfide type curing systems on the relation among heat resistance, oil resistance, and lowtemperature serviceability of nitrile-type synthetic rubbers. Improved balance between oil resistance and low-temperature serviceability is particularly important for military applications in the The best balance among the Arctic. three environmental-resistance properties was found in stock cured with 3 phr. of tetramethyl thiuram disulfide and 0.2 phr of sulfur. The best balance for sulfurcured stocks was obtained with 2 phr of sulfur. A better balance of properties after aging was obtained with thiuramcured stocks. Copy seen: DLC.

48208. STILGENBAUER, FLOYD A. An improved (polar) lobate globoid grid for a polar map of the world and its significance in air navigation. (Michigan Academy of Science, Arts, and Letters. Papers, 1946, pub. 1948. v. 32, p. 265–84, diagrs., charts, maps (1 fold.), tables.)

An improved polar map is described which is a correct interrupted conformal grid, symmetrical in form, equal in area, and extraordinarily correct in shape, direction, and distance relationships. The improved grid is a secant cone construction with the standard parallel at 70° N. This provides no breaks in the land masses except in the Antarctic. Examples of the application of this grid for airplane navigation is given.

48213. STOIBER, RICHARD EDWIN, 1911—, and others. The source area and age of ice-island T-3. Hanover, N. H., Dartmouth College, Dept. of Geology, Nov. 1956. 100 l. diagrs., illus., tables. 58 refs. The research reported in this document has been sponsored by the Geophysics Research Directorate of the Air Force Cambridge Research Center, Air Research and Development Command. Final report under Contract no. AF 19 (604)-1075. Other authors: J. B. Lyons, W. T. Elberty, and R. H. McCrehan.

"Petrographic and mineralogic examination of rocks collected from the surface of T-3 as well as of dusts collected from the surface ice and from ice cores, reveals that the debris originated from an area underlain partly by altered basic volcanics and partly by middle- to highgrade metamorphics and granites. From what is known of the geology of areas bordering the Arctic Ocean, the most probable former sites of T-3 appear to have been either the Cape Bourne or Yelverton Bay areas of northern Ellesmere Island. T-1 evidently has the same provenance. Geologic dating of T-3 is inconclusive. It has not proven possible to tie the mineralogy of the dusts into well-known historic events, such as the eruptions of Vesuvius (79 A. D.) or Krakatoa (1883). On the other hand, black magnetic micrometeoritic spherules have been recovered from surface dusts and dusts in ice cores from the island. The relative scarcity of these micrometeorites, along with what is known concerning their probable rate of accretion on the earth's surface, suggests that the age of T-3 may be only a few hundred years or less."-Author's abstract.

Trudy, serifa khimicheskafa, 1956. vyp. 2, p. 20–42, tables.) Text in Russian. Title tr.: Hydrometeorological conditions affecting recovery of salt concentrate on the shores of the Sea of Okhotsk.

Three methods of salt recovery for the fishing industry are described: by natural

(solar) evaporation, by freezing out, and by evaporation of salt concentrates obtained with the first two methods. Concentration of salinity at freezing varies with depth and with vertical distribution of salt content, from 29.8 to 32.9°/oc (gr./ kg.). Hydrometeorological conditions in the area are described in detail, with average and extreme data on air temperatures, wind, snow cover, soil freezing and permafrost, and on ice conditions in the bays and islands of the Sea. Effects of climatic change on salinity are discussed for different shore localities. Maximum salinity at natural freezing may approach 120°/00, with average near 80°/00. Evaporation of the salt concentrates is uneconomic at present due to fuel required, but local development of hydroelectric power is feasible. Problems of power production and location of plant sites along the coast are analyzed.

of old and new times . . . with a not hitherto published Tabula polyglotta of thirty-two kinds of Tatar languages and a Kalmuk vocabulary, but especially with a large, correct map of the countries mentioned.

English translation, An historico-geographical description . . . London, 1738 (463 p. plates, map, table), in DLC.

Stralenberg, a Swedish army officer captured at the battle of Poltava in 1709 spent 13 years in captivity, mainly at Tobolsk (58°15' N. 68°30' E.). During this time he made first drafts of his map and collected the material on which this book is based. He describes in encyclopedic variety, things he saw and heard about. In his historical-geographical narrative, also in an alphabetically arranged miscellany (p. 308-438) he deals with government, church, military power, economics, mining, trade, etc., flora, fauna, peoples, settlements, etc. References to arctic areas and conditions occur throughout the work: boundaries, climate, etc., are dealt with in chap. 2-3 (p. 171, 179), the Kolyma-Kamchatka and the Far East region (p. 431-38), etc. An extensive index is added to the text. On Stralenberg's map see Arctic Bibliography, No. 17106.

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31-Nov. 2, 1956. During last glacial maximum, present areas of significant silt deposits were occupied by Knik ice. Alluvial deposition of the Matanuska River during the ice retreat, and chronological relation of the silt deposits to the alluvial forms are discussed. Silts are older than the Knik flood plain which has been assumed an important source area. Prevailing colian theory for origin of the silts must be revised.

Ames, Iowa, June 1, 1956. iv, 89 l., 24 illus., diagrs., maps, 5 tables on 17 l. (Iowa State College. Engineering Experiment Station, Final report I. Project 320—S. Contract Nonr-530(04), Geography Branch, Office of Naval Research) 38 refs. Other authors: R. L. Handy, D. T. Davidson, C. J. Roy, and L. A. Thomas.

Contains a summary of the various geologic and engineering properties of the Matanuska valley silts and descriptions of the silt relationships and geomor-A previous progress report (No. 48237) includes field descriptions of the Matanuska valley silts, a preliminary account of their various properties, and a detailed account of their thickness and particle-size distribution. Additional data derived from tests and field work since 1 June 1955 are included in this final report. A comparison is made of the silt properties with materials of similar particle-size distribution found in the United States. Petrographic analysis of several samples indicates that the silts have a mineral composition similar to that presently being carried by both the Matanuska and Knik Rivers. The silts may be composed of as much as 50 percent slate and/or phyllite rock fragments. Quartz is another abundant constituent. Differential thermal and X-ray analysis indicates chlorite is the dominant clay mineral, although some illite and possibly kaolinite are also present. Plasticity varies only slightly in the silts. Standard Proctor densities are slightly lower and C. B. R. values slightly higher for the silts than for loess. Various theories of origin of the silts are described and assessed on the basis of the various Copy seen: CaMAI. silt properties.

48237. STUMP, RICHARD W., and others. Property studies of Alaskan silts in the Matanuska valley, Big Delta and Fairbanks areas. Ames, Iowa, Dec. 1, 1955. 3 p. l., ii, 38 l., 37 illus., diagrs., maps on 19 l., tables. (Iowa State College. Engineering Experiment Station, Progress report. Project 320–S. Contract Nonr – 530 (04) Geography Branch, Office of Naval Research) 8 refs. Other authors: R. L. Handy, D. T. Davidson, and C. J. Roy.

Contains results of the first year's (1954) work on silty materials of the Matanuska valley; data from field studies and laboratory tests are included. Sample locations were selected along five traverses, and in a grid pattern. The silts overlie a variety of glacial and alluvial deposits as a surficial deposit. The thickest silts are north of Palmer, with the thickness decreasing west of the Matanuska River toward the south and west; east of the river distribution varies. Particle size generally decreases with decreasing thickness and shows little variation vertically except in the basal portion where the material is usually much coarser. Five, possibly

six, volcanic ash layers are present in the thick silt, but only remnants in the thin silt sections. Mechanical analyses and consistency limits of all 91 samples showed 92 percent classified texturally as silty loam, and 85 percent had an engineering classification of A-4(8). The plasticity index averaged 3.54. A preliminary survey of the Big Delta region and a reconnaissance of the Fairbanks area were made. Copy seen: CaMAI.

48240. SUBBOTIN, A. I. K voprosu o zimnikh profsessakh na severovostoke Azii. (In: Khromov, S. P. Sinopticheskie profsessy Dal'nego Vostoka, 1940. p. 5-63, tables, maps, graphs.) 4 refs. Text in Russian. Title tr.: Problems of

winter synoptic situations in northeastern Asia.

Atmospheric circulation during winters 1935-1938 is described on the basis of old records and the author's observations. Geographic and topographic characteristics of the region are covered from 55° to 63° N. and 135° to 165° E. with numerous charts. Description of fauna, flora and permafrost conditions are given for four regions: Udskiy, Ayanskiy, Okhotskogizhiginskiy and Penzhinskiy. Special features of the Sea of Okhotsk and the Bering Sea are described with ice characteristics during autumn, winter and spring. General air circulation is analyzed in connection with specific climatic changes from the Lena basin and Yakutsk to the Indigirka and Kolyma basins, Chukotsk Peninsula, Bering Sea, and Aleutian Islands. Topography of the Nagayeva Bay area on the Sea of Okhotsk is described in detail (p. 27-30) with tabulated meteorological Movements of air masses and data. major fronts are analyzed in relation to the continental polar and arctic air currents from the Yakutsk region to Sea of Okhotsk. Movements of warm polar ocean air of Pacific origin are initiated from the Kuril to Commander Islands, and after rising they are directed north to Vrangel Island. The north-Okhotsk arctic front movement is discussed. Typical winter synoptic processes are classified into three main groups: frontal processes; western, connected with the Siberian maximum; and eastern, connected with the Aleutian maximum.

**48241.** SUCKSDORFF, E. The geophysical observatory Sodankylä. (Geophysica, 1952. v. 5, no. 1, p. 17–47, illus.,

map.) 3 refs.

Laboratory facilities and research program of this Finnish Observatory located along the river Kitinen at 67°22' N. 26°39' E. are described. A temporary observatory was operated at this location during the First International Polar Year. The first permanent buildings were erected in 1913 and actual operation began on Jan. 1, 1914. For ten years, the station was the only permanent observatory within the Arctic Circle. It was demolished by German forces in 1944. Reconstruction was started on Jan. 1, 1946, and the magnetic recording work was resumed. A survey of the various branches of geophysical work formerly carried on is given, including geomagnetism, earth currents, induction currents, auroral observations, atmospheric potential gradient, and solar radiation, and meteorology. Personnel are mentioned and some publications cited. The rebuilt station functions so far solely as a geomagnetic observatory. A meteorological-aerological observatory nearby has been in operation since 1949.

48243. SUCKSDORFF, E. Vom Polarlicht. (Suomalainen tiedeakatemia. Sitzungsberichte, 1951, p. 97–109.) Text in German. *Title tr.*: The aurora.

Auroras' visibility distribution over the earth's surface, and their relationship to electricity and magnetism are considered. Three auroral forms observed in Lapland are described: steady bow, wavering lights, and flame. Their relationship to each other and to magnetic intensity, and the space and time relationships are discussed to clarify some theoretical aspects of the origin and significance of auroras.

48244. SUDA, ISAMU, and others. Effects of cooling on central nervous system responses. (Federation proceedings, Mar. 1956. v. 15, no. 1, pt. 1, p. 182.) Other authors: K. Koizumi and C. McC. Brooks.

Cooling of the cord caused marked increase of spinal reflex responses before depression set in. Similar results were obtained by cooling the blood supply to the cord or to the brain and by cooling the brain surface, alone, or in conjunction with blood cooling. The physiology of this phenomenon is analyzed and discussed.

"Permafrost investigations during the thaw period from Sept. 29-Oct. 3, 1943 are described. The amount of frost heaving to be expected is calculated, and the origin of permafrost is discussed. Soil samples were taken both from the active layer (2 m. thick) and the permafrost layer; the ice structure, water content, and composition were analyzed. The structure of the permafrost layer was similar to that observed in heaved soils. The permafrost originated at the surface and was buried to its present depth by successive layers of soil washed down from slopes during repeated periods of melting. Data are tabulated on soil temperatures to a depth of 2.20 m., on the amount of frost heaving in individual layers and in its entirety and on grainsize distribution in the active and permafrost layers. Soil profiles are diagrammed, and a formula for calculating the frostheaving ratio is presented."-SIPRE.

P., and others: Led . . . 1940. p. 460-90, illus., table, map, diagr.) 16 refs. Text in Russian. *Title tr.*: Ice in permafrost.

Ground conditions are analyzed and classified in respect to duration of permafrost and geographic location. Intensity of permafrost or depth of its penetration is tabulated for different Russian localities. Permafrost is also classified according to the origin of the ice. Quantitative properties of frozen ground (moisture, volumetric ice content, water penetrability, etc.) are discussed and analytically formulated. Processes of water migration and freezing of top layers with "naled's" or their deformation with heaves ("puchenie") are explained with illus. Mechanical properties of frozen ground are given in connection with building and road construction and with consideration of changes in thermal conditions of the active layer. Copy seen: DLC.

48252. SUMGIN, MIKHAIL IVANO-VICH, 1873–1942. Vechnafa merzlota kak indikator vekovykh kolebanif klimata. (In: Vsesofiznyl geograficheskif s'ezd. 1st, Leningrad, 1933. Trudy, 1934, vyp. 3, p. 22–23, graphs.) Text in Russian. Title tr.: Permafrost as an index of secular climatic trends.

"The temperature distribution in the upper strata of the earth and ground deformation associated with permafrost degradation are discussed. Numerous sinkholes and lakes in the area between the lower stretches of the Indigirka River and the Tunkin Depression appeared after permafrost degradation. Permafrost alters the conventional distribution of soil temperatures with depth; and permafrost temperatures, the depth of the min., and variations in these values can be considered indexes of the present state of permafrost, its degradation, and the secular climatic trend. Permafrost degradation observed in the Usa River basin (66° N. 60° E.) and near Lake Baykal indicate climatic warming in these areas." -SIPRE. Copy seen: DLC.

SUMMERS, W. B., see Eiseman, B., and others. Prolonged hypothermia . . . pneumococcal peritonitis. 1956. No. 44749.

48254. SUMNER, LOWELL, 1907—. Your stake in Alaska's wildlife and wilderness. (Sierra Club bulletin, Dec. 1956. v. 41, no. 10, p. 54-71, 32 illus.) 17 refs.

In 1951-1953, the writer completed a preliminary biological survey of Alaska (except Aleutians) as part of the U.S. National Park Service Alaska Recreation Survey. Basic differences between Alaska and continental U.S. in available natural resources, related land use possibilities and revenues therefrom are pointed out. Revenues from Alaskan natural resources are discussed; the non-monetary values and means of measuring them, also value of the tourist industry are considered. Decline of many forms of wildlife and of forests is noted; fish, wildlife, and scenery are stressed as Alaska's greatest economic asset; and recommendations are made for conservation. Excellent photographs of mammals and birds are included.

48256. SUNDE, ALV. Studies of winds off western Greenland. (Norway. Meteorologiske annaler, 1956. bd. 4, nr. 4, p. 37–54, 17 text maps, 4 graphs, table.)

Modification of air currents and pressure by the mountains of West Greenland and eastern Baffin were studied on the basis of synoptic observations and notes from logs of Norwegian fishing vessels (May-Oct. 1951 and 1952). Development of lee troughs in western Greenland is

discussed, and air pressure observations for six stations during eight occurrences in 1951 are tabulated. Depressions in southern Davis Strait, over Baffin and northern Davis Strait, and those moving along the west coast of Greenland are considered in turn. Depressions with tracks having a southerly component are infrequent compared with those having a northerly. Very intensive depressions seem more frequent in southern than in northern Davis Strait. The area studied is important to the fishing industries for depressions in the Strait are indicators of bad weather on the fishing banks.

48268. SUTHERLAND-BROWN, M. C. Northwest highway system. (Canadian Army journal, July 1956. v. 10, no. 3,

p. 118-29, illus., text map.)

The historical development of the Canadian part of the Alaska Highway is described. The U.S. Army turned over to the Canadian Army responsibility for the operation and maintenance of the road from Dawson Creek, B. C., via Whitehorse in Yukon Territory to the Canada-Alaska Boundary (1221.4 miles) on April 1, 1946. These functions are carried out by a part of the Army known as the Northwest Highway System (NWHS); its organization is described. Traffic on the Highway has increased steadily since first opened to unrestricted civilian traffic in 1947. Maximum number of vehicles per day range from 1,000 at mile 48, Fort St. John, to 130 at mile 1,200. A map of the Highway is included together with several illustrations of bridges and construction activities.

This disease is not as rare in Norway as is commonly believed. The primary host is the dog; reindeer are often the secondary host, and sometimes man. Echinococcosis is most widely spread in northern Norway, especially among people who handle reindeer, in whom it is apt to occur in cyst form; it is also found in northernmost Finland and Sweden.

48279. SVATKOV, N. M. Sledy smeshchenia granisy drevesno' rastitel'nosti na Oleneksko-Lenskom vodorazdele. (Botanicheskii zhurnal, Oct. 1956. t. 41, no. 10, p. 1488–90, text map.) 4 refs. Text in Russian. Title tr: Vestiges of the fluctuation of the woody vegetation limit on the Olenek-Lena watershed.

Describes some trunks of ancient larch found in the tundra, 250 km. from the arctic coast and about 125 km. from the nearest settlement (approx. 70°50′ N.) They are probably of local origin, as it seems unlikely they were brought to the tundra by natives, who don't use such timber for their household purposes. Trees of the same size are now found 200-250 km. to the south. In some phase of

post-glacial period, the northern limit of woody vegetation was north of the present one. **Copy seen:** DLC.

48280. SVEISTRUP, POUL PETER, 1892- . Kryoliten og staten. (Grønland, Feb. 1956, nr. 2, p. 41-49, illus.) Text in Danish. *Title tr.:* The cryolite and the state.

Contains a short history of the relationship between the Danish state and private mining companies at the cryolite mine at Ivigtut, West Greenland. The first concession for industrial use of the cryolite was given in 1853. The Greenland Trading Company was given monopoly of mining at Ivigtut that year, but mining concessions were given to private interests as from 1856; during 1865-1940, to Kryolith Mine og Handels Selskabet, and since 1940 to Kryolitselskabet Øresund A/S, which was formed as result of long cooperation between the old company, Øresunds chemiske Fabriker (which had purified and sold the cryolite), and the state. 48286. SVENONIUS, FREDRIK VIL-HELM, 1852-1928. Om några svenska (Geologiska föreningen, Stockjöklar. holm. Förhandlingar, 1878. häfte 1, no. 43, p. 18-27.) Re bd. 4, Refs in text. Text in Swedish. Title tr.: On some Swedish mountain glaciers.

Glaciers on Akavare and Sulitjelma

were traversed. Attention is called to angles of slope, variety of transported rock, inner moraines, dirt bands, ice color and crystal form, moulins, longitudinal and transverse crack systems. Attempt was made to measure forward movement. Altitude, snow limit, and lower limit of glaciers were compared with Folgefonna in Norway. Copy seen: DGS

48287. SVENONIUS, FREDRIK VIL-HELM, 1852-1928. Om oskiktade terrasser i Lappland. (Geologiska föreningen, Stockholm. Förhandlingar, 1887. bd. 9, häfte 1, no. 106, p. 13-14.) Title tr.: On unstratified in Swedish. terraces in Lapland.

Above the limit of birch growth, 250-300 ft. above Situojaur, a lake northnorthwest of Kvikkjokk, are morainic terraces of large and small stones and sand; they bear witness to a damming of the lake by ice during its recession. Similar terraces are found near Torneträsk and Lajdaur. Alternative possible means of terrace development are outlined. Copy seen: DGS.

48288. SVENONIUS, FREDRIK VIL-HELM, 1852-1928. Studier vid svenska jöklar. (Geologiska föreningen, Stock-holm. Förhandlingar, 1884. bd. 7, häfte 1, no. 85, p. 5-38, 3 plates.) Refs. in text. Text in Swedish. Title tr.: Investigations of Swedish glaciers.

Northern Sweden's glacier region, its distribution, characteristics, and relation to topography, elevation, and precipitation are compared to those in southcentral Europe. The Luotoh glacier is described: its snow and ice, moraines, dirt bands, crack systems, transport, removal of solid matter, and ice movement. Variations in glacial stream flow and deposits are noted and changes in volume of glaciers are considered.

Copy seen: DGS.

48289. SVENONIUS, FREDRIK VIL-HELM, 1852-1928. Undersökningar rörande Sveriges jöklar. (Svenska turistföreningen, Stockholm. Arsskrift, 1896. p. 304-306.) Text in Swedish. tr.: Investigations of Sweden's glaciers.

In connection with studies by the Commission Internationale des Glaciers, of the International Geological Congress in Zurich, 1894, investigations of Sweden's glaciers are needed. Reports on mapping, photography, precise measurements of various kinds, and landscape descriptions are requested, and methods of in-

vestigation outlined.

A sequel, pub. in the same journal 1897, p. 363-65, states requirements more specifically for Norrland: to map the present extent of all glaciers, and determine later changes by photography and mapping. Several score glaciers in Arjeplog, Sulitjelma, Kvikkjokk, Gällivare, Jukkasjärvi, and Enontekis regions are listed.

Contains discussion of technical and economic problems of fishery installations, including those of the White Sea and Far They involve mainly improvements in fleet operations: discharge of catch, supplies, repairs, etc; and quality of product: better storage, preservation, selection, etc.; also in reduction of operating cost by mechanization of loading and transport facilities. Harbor construction and port installations are discussed with consideration of favorable geographic, geological and climatic conditions (direction and force of predominant wind, tide currents and waves) as exemplified in existing ports. The wave theory is outlined; the destructive force of waves on breakwater, piers and other shore construction is calculated. Technical and economic problems in port operation: disposition of moles, piers, arrangement of fishing boats, tugs, barges, loading facilities, etc., are analyzed, and the productivity of the industry is illustrated by tabulated data upon different ports. In appendix 5, characteristics of various types of the fishing ships and tugs are presented in tabular form. Part II has not been seen as yet. Copy seen: DLC.

48309. SVIHLA, ARTHUR. The relation of coloration in mammals to low temperature. (Journal of mammalogy, Aug. 1956. v. 37, no. 3, p. 378-81, tables.) Account of observations by three different methods, of white rats kept in warm and cold (5±1° C.) environment,

C

and the same rats, dyed black, under identical experimental conditions. As far as heat conservation at low temperatures is concerned, no difference was observed between white and black-colored animals. Study was undertaken to test concept of heat conservation attributed to mammals with seasonal change in coloration: snowshoe hare, collared lemming, weasels, arctic fox.

48316. SWANSON, EARL H. Nootka and the California gray whale. (Pacific Northwest quarterly, Apr. 1956. v. 47, no. 2, p. 52–56, 2 tables.) 20 refs.

Discusses possible relationship between movements of this whale along the Pacific Coast (to southern British Columbia) and in Bering Sea, and whaling practices of the Nootka Indians of Vancouver Island in the 19th century. Southwest Alaska Eskimo influences were strong in southern British Columbia at an earlier period; the Nootka still possess traits considered to

be of Eskimo derivation. Possible cultural relationships between the Nootka and Aleut-Kodiak region are also discussed. "The importance of the California gray whale is that it appears to have been as much a part of the whaling complex in the North Pacific as was the harpoon. This would tie in Nootka whaling with the Eskimo, Koryak, and Chukchee rather than with the Aleut-Kodiak region." The whale's absence from coasts of northern B. C. - Southeast Alaska may account for absence of whaling practices among the Tlingit and Haida Indians.

Description des stations météorologiques Suédoises pouvant figurer aux météoradiogrammes internationaux publiée conformément à la résolution XLI de la conférence des directeurs à Utrecht, 1923. Stockholm, 1927. 19 p. maps. (Its: Publication no. 26). Text in French. Title tr: Description of Swedish meteorological stations.

A brief description is given of each of 19 stations including Abisko, Gällivare and Haparanda. Geographic coordinates, elevation, and local environment are indicated. The equipment or method used for obtaining each of the meteorological elements is given. A small topographic map of each station and environs is included. Copy seen: DLC.

48321. SWEETING, MARJORIE, and G. GROOM. Notes on the glacier fluctuations in Bünsow Land, central Vestspitsbergen. (Journal of glaciology, Mar. 1956. v. 2, no. 19, p. 640–41, 2 text maps (p. 633).) 7 refs.

From the 1953 Cambridge Spitsbergen Physiological Expedition, at the northern end of Billefjorden (78°30' N. 16° E.): Thin ice caps nourishing short valley glaciers occur on many of the broad summits. "Cascade" or "slab" glaciers on cliffs, valley walls, or gullies are a distinctive feature. All glaciers observed showed signs of marked recession; map (p. 633) indicates changes since W. B.

Harland's of 1949 (Arctic Bibliography, No. 22430). As result of increased ablation, existing ice caps are thinning so rapidly that they fail to replenish their dependent glaciers. Many "cascade" and corrie glaciers have become dead ice.

48322. SWENSON, E. G. Winter concreting in Scandinavia. (Engineering and contract record, Oct. 1956. v. 69, no. 10, p. 114+.)

Contains a general review of a symposium held in Copenhagen in Feb. 1956 for the purpose of coordinating and assessing the theoretical and practical developments in cold-weather concreting. Subjects dealt with included weather and climate in relation to winter operations, the influence of temperature on the hardening of concrete, the frost resistance of concrete at early ages, choice of materials, heating, insulation, and procedure and equipment on the job. Field research and practice are most advanced in Canada; laboratory research in Europe.

48323. SWITHINBANK, CHARLES WINTHROP MOLESWORTH, 1926—. The origin of dirt cones on glaciers. (Journal of glaciology, Oct. 1950. v. 1, no. 8, p. 461–65, diagr.) 11 refs.

Discussion primarily of characteristics and probable development of dirt cones on Vatnajökull, Iceland, but brief comparisons are made with similar features on Søbre, Jan Mayen and on Malaspina, Spencer, and Mendenhall glaciers in southern Alaska. Under given conditions of ablation, the nature of the debris covering is the deciding factor in formation of the cones, in particular its radiation absorption coefficient, conductivity, and thickness. All dirt cones result from differential ablation, although the nature of the debris and of the ablation varies greatly in different locations.

Title tr.: In the Far East taiga; a hunter's notes. Third edition considerably revised and enlarged, of a work previously pub. (1949, 1952) as: Okhota v Khabarovskom krae (Hunting in Khabarovsk Province).

Deals with commercial game animals of northeast Asia from Chukotka southward (to 42° N.), and with methods of hunting and trapping them, from 20 years' experience. Fur animals, marine mammals and birds in Chukotka, the Anadyr' basin, Kamchatka and adjacent waters are described, among them; sable, otter, ermine, bear, wolverine, fox, arctic fox, squirrel, muskrat, elk, wild reindeer; walrus, seal, bearded seal, sea lion, sea otter, geese, swans, ducks, etc. Wildlife conservation and acclimatization of valuable new species in hunting areas is discussed (p. 168-77). Technical aspects of hunting are treated in appendix (p. 178-90): weapons, traps, equipment, means of transportation, dwellings, rest huts, preservation of catch, dogs, etc., also organization of hunters.

The Anchor Field Party was organized late in the season of 1953 by the Transportation Arctic Group to survey and mark a safe trail for heavy equipment between Thule Takeoff and Camp Alpha northwest Greenland. The region is contained in the quadrangle bounded by the parallels of latitude 76°20' and 76°50' N. and longitude 65°20' and 68°30' W. Five astronomical fixes were established. All bearings and directions were observed with the Wild T-2 theodolite. All crevasses observed were entered on the base map. None was wider than 5 ft. and all were bridged by 6-8 ft. of frozen snow. A base map of the trail is included and a profile of the best route was drawn. Copy seen: CaMAI.

refs. Translated from the Swedish by Mark L. Anderson.

Bedrock, climate, altitude, exposure, and terrain features of northern Sweden are outlined. Growth conditions of the forest are described, with discussion of the relationships of forest associations to local conditions. The associations are considered as productivity classes and treatment types. Soil science in forestry is contrasted with that in agriculture. Specific forest associations are related to variations in podsolization. Forest improvement possibilities in Sweden are discussed with reference to practices in Finland; and conditions in Scandinavia and the Kola Peninsula are compared with those of Siberia where productive forest is often found above permafrost. diagrs., cross-sections. Mimeographed. (Contract no. Nonr-1070 (00)). Approx. 600 refs.

A detailed survey of the northern group of Canadian Arctic Islands (74°-81° N. 80°-125° W.) in four large sections, complementing the historical coverage in No. 42763. The introductory section, comprising v. 1 and 2, deals briefly (in v. 1) with the island group as a whole, its setting, exploration, administration, etc., general description of each island, climate, cartography, oceanography, flora and fauna, human geography, archeology, North Magnetic Pole; then, in much more detail, the geology. Volume 2 covers glaciology, the present distribution of land ice, the fiords of Ellesmere and Axel Heiberg as a key to Pleistocene glaciation, and the sequence of events during the Pleistocene. In the second large section (v. 3-10) the physiography of each island in the Queen Elizabeth group is described in turn, starting with Ellesmere and working south, then west. A brief history of exploration, relief, drainage pattern, geology, glacial cover (if present), mineral resources (if any), are given, followed by a detailed regional description of the island, especially coastal areas. The third and fourth major sections consist of the bibliography (v. 11), and preliminary base maps (v. 12) of the area, in scale 8 mi: 1 in. in ten sheets, viz,: Northern, Southern Ellesmere, Devon and Cornwallis, Bathurst, Findlay group, Melville, Prince Patrick, Stefansson, Ringnes, and Axel Heiberg Islands. The individual volumes (not listed separately in this Bibliography) are:

48350. TAYLOR, R. S. Glacial geology of north-central Keewatin, Northwest Territories, Canada. (Geological Society of America, Bulletin, Aug. 1956. v. 67, no. 8, p. 943–55, 6 maps (1 fold.), diagrs.,

graph.) 28 refs.

Contains results of field work in the area, 65°40'-66°40' N. 96°10'-99°20' W., in July-Aug. 1953 during the Univ. of Minnesota-Wilkie Back River Expedition led by W. J. Breckenridge. Much of the area is mantled by till, whose thickness exceeds 100 ft. in places. A complex history of glacierization is recorded by drumlins of diverse patterns, by eskers, and by features eroded in bedrock. The eskers form a dendritic pattern and are believed the result of regressive deposition from consequent superglacial streams. Some transitory proglacial lakes existed, but there has been no post-Wisconsin marine submergence. . . . The recorded sequence of ice movements, from oldest to youngest is to southeast, to north, to N. 30° W., and to N. 60° W. A carbon-14 age determination of 4140 ± 150 yrs. was made on peat buried by the last ice advance. From author's abstract.

48351. TAYLOR, RAYMOND FRANK, 1897—. The role of forest research in developing an Alaskan resource. (In: Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 97–105.)

Site factors affecting tree growth are stated and need for their study stressed. Organized forest research initiated in Southeast Alaska in 1948, should be started also in the Interior. Work of the Alaska Forest Research Center is outlined in its appraisal of the Tongass National Forest: of its 16 million acres, three million are in commercial forest, mostly decrepit over-mature climax forest. Cutting is recommended, and old stands replaced by young trees. Advantages of clearcutting over the selection system in this area are discussed; also the conversion of the ancient stands to secondgrowth. Copy seen: DGS.

48359. TENGWALL, TOR ÅKE. Die Gefässpflanzen des Sarekgebietes. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 3, Botanik, Lfg. 7, pub. 1925. p. 627–74.) Text in German. Title tr.: The vascular plants of the Sarek region.

Localities investigated by the author in the summers of 1913–1918 are stated, and a systematic, annotated list is given of 33 ferns and fern allies together with 300 other vascular plants; localities and distributional data, habitat and frequency, etc., are indicated.

Copy seen: MH-A.

48360. TENGWALL, TOR ÅKE. Nachtrag zur Flechtenflora des Sarekgebietes. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 3, Botanik, Lfg. 7, pub. 1925. p. 694–702.) 5 refs. Text in German. Title tr.: Supplement to the lichen flora of the Sarek region.

Contains a systematic annotated list of about a hundred lichen species and forms, mostly collected by the author in the summers of 1913–1918, with data on habitat. Six species were not previously recorded in the region. Supplementary to No. 47049.

Copy seen: MH-A.

48361. TENGWALL, TOR ÅKE. Die Vegetation des Sarekgebietes, Abteilung I–II. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 3, Botanik, Lfg. 4, pub. 1920, p. 269–436, 73 illus., plates 10–11 (fold. maps), 11 tables; (II) Lfg. 8, pub. 1925, p. 703–774, 24 illus., 15 tables.) 135+105 refs. Text in German. Titte tr.: The vegetation of the Sarek region, I–II.

Contains, in pt. I, a survey of physical conditions of this high mountain region of Swedish Lapland and of its zonal subdivisions: general geography, topography, geology, meteorology with tabular data; account of the distribution of the woody vegetation and northern tree line (table 11); a study of plant associations: birch forests, shrubs, meadows and aquatic plant formations, with lists of their typical and common species. The two main vegetation regions, sub-alpine and alpine, are described according to their geographical sections.

Pt. 2 is a study of the ecological factors influencing alpine vegetation, such as snow, water content of various substrata in the investigated region, and calcium content in the substrates, with tabulated data of each. The succession of vegetation in deltas of various mountain springs and rivulets (especially Laitaure delta) and constant species of some alpine associations and their relation to ecological factors are noted. The history of flora and vegetation of Sarek region in glacial and post-glacial periods is discussed.

THOMAS, MORLEY K., see Boughner, C. C., and others. Climatic summaries . . . III; frost data. 1956. No. 44103.

48373. THOMASSON, KUNO. Reflections on arctic and alpine lakes. (Oikos, 1956. v. 7, no. 1, p. 117-43, 14 illus.) 40 refs.

Such hydroclimatic factors are con-

sidered as: insolation (small supply of heat and short vegetational period); heat economy (losses due to radiation are much smaller than on land); ultra-violet radiation, which is of great biological importance; and nutritive materials in such small amounts in these lakes as to constitute a limiting factor. Plankton composition is discussed on the basis of material from several lakes in the Abisko and Torneträsk regions, two in the Kebnekaise massif (species listed), also some alpine lakes in Norway, central Europe and elsewhere. Its cosmopolitan character is stressed: both arctic and alpine plankton represent impoverished variants of the communities of lower latitudes and altitudes respectively, the impoverishment of phyto- increasing with latitude and altitude, at a faster rate than zooplankton. In conclusion, problems in classification of lakes are reviewed; arctic and alpine lakes are characterized as ultra-oligotrophic and feebly productive, but significant in elucidation of basic ecological problems.

48376. THOMPKINS, R. W. Designs for heating mine air. (Canadian mining journal, Sept. 1956. v. 77, no. 9, p. 102–104, diagrs.)

Freezing surface temperatures often necessitate heating air used for mine ventilation. Importance of weather data is discussed, also amount of heat required, steam coil heating and heater controls, counter-flow heaters. Copy seen: DGS.

48377. THOMPSON, HUGH RALPH, 1926—, and B. H. BONNLANDER. Temperature measurements at a cirque bergschrund in Baffin Island: some results of W. R. B. Battle's work in 1953. (Journal of glaciology, Oct. 1956. v. 2,

no. 20, p. 762-69, illus., graph.) 12 refs. Results of field work in Pangnirtung Pass (approx. 66°06' N. 65°58' W.) during the Arctic Institute's Baffin Island Expedition, summer 1953. "Thermograph, thermistor, and thermometer readings at a 30 m. deep bergschrund from June 6 to July 22, 1953, showed . . . little direct relationship between air temperatures outside and at the bottom of the schrund. The air temperature inside ranged from  $-3.7^{\circ}$  C.  $(25.3^{\circ}$  F.) to +0.5° C. (32.9° F.), but from July 2 onwards it oscillated between  $-0.5^{\circ}$  C. and +0.5° C., with a 3-4 day periodicity. The ice temperature at the bottom of the schrund behaved similarly, though it was about 0.5° C. colder. The oscillations may have been caused by the interplay of flowing meltwater (source of heat) and air drainage in quiet weather (source of cold). The granite-gneiss headwall, where not sheathed by refrozen melt water, appeared to be chemically and mechanically unweathered." - Authors' abstract. Copy seen: DGS.

48378. THOMPSON, RALPH F. Water treatment, Ladd Air Force Base. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 64-67, tables.)

The design of a large capacity water treatment plant is described. It is designed for a daily normal rate of flow of 1.2 M. G. D., water being supplied by a deep well turbine pump of 750 gpm capacity. Breakpoint chlorination dosage followed by rapid mixing, sedimenta-

tion and rigid sand filtration are used for treating. A summary of the test results of pilot plant treatments is given, and operational statistics are included. All treating facilities are completely enclosed in heated buildings. *Copy seen:* DGS.

(American journal of science, Apr. 1956. v. 254, no. 4, p. 227-38, graphs.) 14 refs. Also pub. as: Washington (State), University, Dept. of Oceanography, Contribution, no. 191. Discussion by George W. Bain in this journal, Dec. 1956, v. 254, no. 12, p. 758-60.

Presents "evidence that the origin of some salt deposits may have occurred from the concentration of sea water under frigid conditions rather than by evapora-The order in which salts deposit from brines subjected to such conditions differs from the order in which salts deposit by evaporation. Concentrated brines result from the freezing of sea water from which small quantities of calcium carbonate precipitate. On cooling, sodium sulfate decahydrate is deposited from the brines, followed by the depositions of the sodium chloride dihydrate, potassium chloride, and magnesium chloride. Carnalite can form only as the result of secondary reactions. The embayment and bar theory of Bischof and Ochsenius is applied to explain the deposition of salts by frigid concentration from sea water and also to explain the formation of some sulfate lakes."—Authors' abstract.

Snow depths seldom exceed 30-36 in. on the plains of the Canadian sub-Arctic, eastern Siberia, and mid-continental This cover, after metamorphism, Russia. provides frontal motion resistance by a structured snow, and traction and flotation by a disaggregated snow. Sufficient information is available to design and produce a mobile oversnow vehicle. At least two alternate methods are available: (1) provide sufficient belly height to allow operation on the relatively hard underlying surface and a narrow enough track or wheel to sink expeditiously to the hard layer at low track or wheel slips and low frontal motion resistance; (2) provide sufficient wheel or sprocket torque to allow for the motion resistance of a snow plow or blower while the vehicle itself operates on bare ground or shallow snow. 48385. THORNE, ROBERT L., and R. R. WELLS. Studies of the Snettisham magnetite deposit, southeastern Alaska. Washington, D. C., Feb. 1956. 41 p. 7 text maps, 2 graphs, 8 sections, 10 tables. (U. S. Bureau of Mines. Report of investigations 5195.) 4 refs.

Studies of a large basic intrusive containing titaniferous magnetite on Snettisham Peninsula were conducted in 1952–1954. Physical features, climate, history and ownership of the region (57°59′ N. 133°46′ W.) are briefly described. Northern part of the peninsula is composed of pyroxenite and diorite intruded into phyllite. The pyroxenite contains magnetite, generally disseminated but also in localized concentrations. The diorite

contains magnetite in smaller percent-Intrusive occupies land area of approx. 390 acres and extends under the waters of Port Snettisham inlet for an unknown distance. Transit and magnetic surveys, diamond core drilling, core sampling and analysis, and beneficiation studies are described. Results are given in tables and graphs. Core samples assayed 11-45 percent total iron. Beneficiation by standard, comparatively lowcost methods resulted in recovery of 61-64 percent of the total iron in a concentrate assaying about 64 percent iron, 3.5 percent TiO2, 0.3 percent V, 0.4 percent S, and less than 0.01 percent P. 48386. THORSHAUG, K., and A. F. ROSTED. Researches into the prevalence of trichinosis in animals in arctic and antarctic waters. Oslo, Brøgger, 1956. 15 p. tables. (Norway. Norsk Polarinstitutt. Meddelelser. nr. 80.) 9 refs. Sumaries in English, German and Norwegian. Reprint of Nordisk veterinärmedicin, Stockholm, 1956, bd. 8, nr. 2, p. 115-29.

Account of investigations made during 1949-53 largely in arctic areas: the socalled North and East ice (area between Spitsbergen, Bjørnøya, Novaya Zemlya, Zemlya Frantsa-Iosifa and Murmansk), West ice (drift ice between Jan Mayen and East Greenland), Newfoundland, Denmark Strait. In polar bears, infection rate ranged from 16.67 percent in onetwo year old animals, to 79.31 percent in old ones, infection being generally of a medium degree. In walruses (73 examined) 9.6 percent showed trichinae; of four specimens from dogs, one was infected. No trichinae were found in bearded seal, bladder-nose, Greenland seal, ringed seal, Weddel, Ross, or leopard seal, finback, sperm whale, white whale and Greenland shark. Seal stocks of the West ice and Newfoundland are free of infection; but Spitsbergen and eastern waters stock are suspect due to high infection rate among polar bears. Role of walrus is stressed. *Copy seen:* DGS.

Pitchblende from the rich ore in upper levels of mines at Port Radium (on Great Bear Lake, 66°03′ N. 117°53′ W.) was recovered by gravity concentration for many years. In lower mine levels, pitchblende is finely disseminated. Progress towards better method of recovery is traced from 1946 to 1952 when present leaching plant was completed. Leaching process is based on extraction of uranium by treatment of the ore with weak unheated sulphuric acid solutions in the presence of an oxidizing agent. The chemistry of both leaching and precipitation processes is described, supplemented by graph and tables.

Certain forest islands of Larix daurica, Alnus fruticosa and Salix species in the treeless tundra zone are described. They were observed on Tit-Ary Island, 60 km. from the Lena delta, also 10 km. north of it on the right bank of the Lena, in the summer of 1955. Forest elements, it is concluded, are moving actively northward in the Lena basin into the tundra zone. They occupy first the edges of swamps and tetragonal terraces. Alnus species move first and are followed by the

spruce, Larix daurica, and other woody species. This forward movement probably started about 400 years ago. Study of the relationship between forest and tundra is recommended for solution of the treeless tundra problem.

48399. TIKHOMIROV, BORIS ANA-TOL'EVICH. Les i tundra. (Priroda, July 1956. god 45, no. 7, p. 31–38, 5 illus., text map.) 6 refs. Text in Russian. Title tr.: Forest and tundra.

"Agricultural development in tundra under severe climatic and permafrost conditions is discussed, together with the effects of forests on permafrost and soil. Contemporary northern limits of forests are considered to be the result of human and animal activity; there is a possibility of extending these limits several hundred km. northward. Tundra afforestation is important from the agricultural viewpoint because forests decrease wind speed, prevent the snow cover from compacting, and so benefit soil conditions and plant development. Air temperatures in forested areas are higher and the permafrost table is deeper, favoring microbiological activity and the formation of fertile ground strata."-SIPRE.

48400. TIKHOMIROV, BORIS ANATOL'EVICH. Nekotorye osobennosti snezhnogo pokrova tundry i ego vlifanie na sushchestvovanie rastitel'nosti. (In: Akademifâ nauk SSSR. Institut geografii. Sneg i talye vody, 1956. p. 206–239, 8 illus., 6 tables.) 58 refs. Text in Russian. Title tr.: Certain features of snow cover and its effects on the existence of vegetation.

Study of ecological effects of snow cover upon the tundra vegetation based on observations in the Arctic, partly in the Lake Taymyr area during 1947-48 (table 1). The distribution and physical properties of snow are described and its regulatory influence on the height of plants noted. The corrasive influence of hard snow on plants is counterbalanced by its protective effect, when accumulated, against extreme low temperatures and strong winds. The melting snow lowers the level of permafrost in the spring and summer, and deposits some nutritive sediments. The snow- and moss-cover help the flowering plants to withstand the rigors of arctic winter and to continue their biochemical and physiological processes. This is partly due to formation of cavities around the plants under the snow which serve as natural hot-houses. With the advent of spring, the sun's rays reach these plants through the snow and the process of photosynthesis starts earlier. The suggestion is made of a regulatory function of the melting of snow, creating optimum conditions for the development of tundra vegetation.

48403. TIKHOMIROV, BORIS ANA-TOL'EVICH. Znachenie mokhovogo pokrova v zhizni rastenii Krainego Severa. (Botanicheskii zhurnal, Sept.— Oct. 1952. t. 37, no. 5, p. 629-38.) 64 refs. Text in Russian. *Title tr.:* The role of moss cover in plant life in far North. Previously listed as No. 26707.

Characteristics of moss vegetation are discussed to draw attention to its importance in tundra life. Hitherto its negative aspects have been stressed: the moss cover, a poor heat conductor, worsens thermal conditions in summer: its component plants of low nutritional value are a poor source of food for such tundra animals as reindeer, lemmings, some birds, etc. Mosses, however, have a positive role in vascular plant development in the tundra: they protect plants against temperature fluctuations in spring and stabilize ground moisture. Beneath the snow cover, the mosses create hollow spaces with temperature higher than outside, "natural hot-houses" favorable to vascular plant development. protective and assimilating activities of mosses are positive factors in the life of tundra vegetation, and require further study. Textbook approved by the Ministry of Higher Education for the peat institutes.

Revision of No. 17731, especially of the chapters on factors of peat formation, the vegetation cover, classification of peats, etc. (p. 18–180). Physical and chemical properties of peats and sapropels are given for additional types (p. 180– 213). The stratigraphy of the deposits is described (p. 213–306): structural, thermal decomposition characteristics. Sectional and geographic distribution of peat deposits is given for the world (p. 306-347) and for European and Asiatic U. S. S. R. (p. 347-93). Methods and equipment used in survey and mining are described (p. 393-446). Identification characteristics of different peat are given (p. 446-53). Copy seen: DLC.

48417. TJEDER, BO. Nätvingar: Neuroptera. (In: Sjöstedt, Y. Insektfaunan inom Abisko nationalpark, III, pub. in Svenska vetenskapsakademien. Skrifter i naturskyddsärenden. 1931, nr. 18, p. 42–46.) Text in Swedish. Title tr.: Lacewings; Neuroptera.

Seven species representing this insect order in the Swedish Arctic are listed, based on 36 specimens in the Royal Natural History Museum in Stockholm; dates, localities, and associated vegetation are indicated and variations from type specimens noted. Copy seen: DLC.

48418. TJØNNELAND, AUDFINN. A contribution to the zoogeography of Norwegian dragonflies. Bergen, J. Griegs boktr., 1952. 44 p. 2 illus., 26 text maps. (Bergen, Norway. Universitetet. Årbok, 1952. Naturvidenskabelig rekke, no. 15.) 39 refs. Summary in Norwegian.

Contains a systematic list, with distributional data, of 45 species collected chiefly in Sør-Trøndelag, Nord-Trøndelag and Nordland counties. Record of localities and distribution maps are supplied for 26 "true" Norwegian species, i. e. those that live and breed in Norway. The fauna is compared with those of other faunal regions, and is divided into: coast, semi-total, total and southern forms. Copy seen: DLC.

48419. TKACH, V. Komnatnoe solnfse. (Vokrug sveta, Feb. 1956, no. 2, p. 15, illus.) Text in Russian. *Title* tr.: Indoor sunshine.

Inhabitants of northern regions suffer from "light hunger" caused by the long winter night. Special lamps, "artificial suns," providing ultra-violet rays along with light are used in schools, kindergartens and hospitals at Dikson, Igarka and other arctic towns.

Brussels, 1951, pub. 1953. p. 312-14, 3

tables.

Brief discussion of ozone measurements made from 1937–1951 at Tromsø, northern Norway (69°40′ N. 18°58′ E.), by means of sunlight. Monthly mean values and their range of variation 1935–1949, are tabulated, and variations in annual ozone content 1940–1948, shown. Measurements in Svalbard were started in Sept. 1950. Monthly values Sept. 1950–Apr. 1951 are compared with the same period at Tromsø and found to differ only slightly.

48423. TÖRNEBOHM, ALFRED ELIS, 1838–1911. Om de geologiska svårigheterna kring riksgränsen, preliminärt meddelande. (Geologiska föreningen, Stockholm, Förhandlingar, 1885. bd. 7, häfte 8, no. 92, p. 501–510, 3 diagrs.) Refs in text. Text in Swedish. *Title*  tr.: On the geological difficulties along the border, preliminary report.

The quartzites and schists which comprise most of the bedrock in the Norprise most of the bedrock in the Norwegian-Swedish border mountain region are largely of Cambro-Silurian facies origin. Age interpretation of series members from place to place is difficult because of the international nature of the investigation. Unsolved problems are surveyed, with attention to problematic age interpretations and controversial members of the series that outcrop in northern Sweden. Copy seen: DGS.

**48424. TOKAREV, SERGE**. Siberia: grand vistas ahead. (News, Nov. 1, 1956, no. 21 (182), p. 16–17, illus., map.)

Includes mention of the Angara River hydro-electric stations with the planned capacity altogether of 10 million kwt. and an annual production of 70 billion kwt. h.; future industrial developments based in this and other projects are noted, among them Noril'sk.

Copy seen: DLC.

48425. TOKAREV, SERGEĬ ALEK-SANDROVICH, 1899-, and I. S. GURVICH. ĪĀkuty. (In: Akademifā nauk SSSR. Institut ėtnografii. Narody Sibiri, 1956. p. 267–328, illus., col. plates.) 42 refs. Text in Russian. Title tr.: Yakuts.

This population (235,926 by the 1926 census, breakdowns given) is distributed mainly in the middle Lena basin, lower Aldan and Vilyuy; also near the Olekma estuary and along the Yana, Indigirka, Kolyma, Olenek and Anabar Rivers. The history, racial origin, culture and economy (19th century) of this stockraising (cattle and horses) people in the south, fishing and hunting in the north, are outlined. Their transportation, housing, clothing and food are described. Sanitary conditions (poor) and disease (skin diseases, trachoma, tuberculosis, arctic hysteria), social organization, family and marriage customs, religious beliefs, folklore, etc. are discussed as features of traditional Yakut life. The autonomous republic of Yakutia was created in 1922, and advances of the native population under the Soviet regime are described with selected statistics for the 1930-1955 period: industry and river transport, urban construction and settlement in the far North, development of agriculture (mechanization, irrigation, agrotechnical advances, livestock, etc.), fur trade (hunting and fur-animal farming), fishing.

Data are given on collectivization, present-day living conditions of the rural population, and on developments in education, social and health services, etc. Achievements of present-day Yakuts in literature, science and the creative arts are cited in conclusion.

TOKAREV, SERGEĬ ALEK-48426. SANDROVICH, 1899- . Kul'turnye svíazi fakutskogo i russkogo narodov do 1917 goda. (In: Akademifa nauk. Akutskil filial. Institut fazyka, literatury i istorii. Vedushchafa rol' russkogo 1955. p. 83-92.) Text in Title tr.: Cultural ties be-Russian. tween the Yakuts and the Russians before 1917. Pub. in preliminary form, in the newspaper Sofsialisticheskaia Akutiia on Mar. 15, 1947.

Describes Russian colonial policy, stressing its favorable aspects: lack of racial discrimination, abolition of slavery, introduction of tsarist law and order, inclusion of Yakutia into the Russian economic sphere, introduction of agriculture, development of fur trade and mineral resources. The importance of christianization (missionary schools), the creation of a written Yakut language and compilation of the first Yakut grammer (1858) are discussed. The influence of Russian classics on local literature is indicated and the enrichment of the Yakut language by words of Russian origin (over 2,400 by 1920) pointed out. Expeditions of the 17th-19th century which originated in Yakutsk are enumerated. Copy seen: DLC.

48428. TOKAREV, V. A. O seïsmichnosti Arktiki. (Akademiña nauk SSSR. Doklady, Feb. 11, 1956. t. 106, no. 5, p. 904-906.) 10 refs. Text in Russian. Title tr.: The seismicity of the Arctic. English translation by E. R. Hope pub.

by Defence Research Board of Canada,

Directorate of Scientific Information Service, Ottawa, Mar. 1957, its: T242 R (3 p.) Copy at CaMAI.

A general review of seismic activity in the Arctic is presented. Earlier Russian views that a single seismically active zone exists extending from Iceland to southern Alaska is refuted. Actually, several zones may be identified, although of markedly different activity. The most active regions (strongest shocks) are the Greenland Sea, southern Alaska, and Kamchatka. Multiple-shock earthquakes are most frequent in southern Alaska, Jan Mayen, and Iceland.

The problem of permafrost thawing of under fills is mathematically analyzed and the depth of heat penetration is calculated on a formula developed by D. V. Redozubov at the Vorkuta Permafrost Station. The use of overall coefficient "n" of heat penetration to frozen ground in this formula involves difficulties due to its appreciable variation for different ground (from 1.2 to 3.5). The problem may be simplified by experimental determination of thermal and physical

characteristics separately for three (upper, middle, lower) layers of the fill adjacent to permafrost. The computation of average values of thermal factors for each layer separately and combining these averages produces a smaller error than dealing with the entire depth at one step. Final solution of the Redozubov equation is further simplified by graphical representation of left and right components of the equation separately. The intersection of two representative lines gives the solution for the depth of thawing. Copy seen: DLC.

Temperatures on the icecap generally range between 0° F. and 32° F. This is particularly true of the area to the interior beyond Mile 120. Melting was experienced at Mile 120 at the end of July. Light to fresh winds coming from a southeasterly direction predominate on the west slope of the icecap. Winds may rise to 40 mi./hr. The high degree of cloudiness recorded can be taken as typical of the summer season at least for the zone of the icecap bordering the sea and the exposed land areas. The moderating influence of the clouds on the temperature of the air is noted. Little precipitation is encountered, although snow blown by the wind frequently amounts to several inches in one storm. Visibility limitations due to blowing snow and/or fog are customary. Either or both may last up to five days at a time. Photographs show various cloud forma-Copy seen: CaMAI. tions.

48450. TOZER, EDWARD TIMOTHY, 1928— Geological reconnaissance, Prince Patrick, Eglinton, and western Melville Islands, Arctic Archipelago, Northwest Territories. Ottawa, Queen's Printer, 1956. 32 p. fold. map, sections, 3 tables. (Canada. Geological Survey. Paper 55–5.) 32 refs.

Describes the geology of parts of southeastern Prince Patrick, northern Eglinton and western Melville Islands, within the area 75°-77° N. 116°-121° W., based on summer 1954 field work. A brief history of exploration is given; also notes on accessibility and travel, vegetation and wildlife, climate, geomorphology, and glaciation. No evidence exists that continental glaciers covered the islands, and no physiographic features suggesting emergence were seen. The consolidated sediments, ranging from Lower Ordovician to Lower Cretaceous(?) are described. They are overlain by Tertiary and/or Quaternary unconsolidated sands and Structural geology is summarized. Coal occurs in three formations of Devonian and Jurassic-Cretaceous Analyses of five samples are proages. Copy seen: DGS. vided.

48452. TRAINER, FRANK WILSON, 1921—. Ground water in glacial deposits in the Matanuska valley agricultural area, Alaska. (In: Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 232–33.)

Permeable stream-laid gravel and sand is best water-bearing material. Glacial till is relatively impermeable. In many gravel deposits at land surface, water occurs under water-table conditions. Artesian water is present where saturated gravel lies beneath till cover. Loess and sand are important in their effect on infiltration from the land surface.

48453. TREATIES. Zur Abgrenzung der Einflussgebiete im Hohen Norden. (Europa Archiv, Jan. 1948. Jahrg. 3, Folge 1, p. 1109-1110.) Text in German. Title tr.: Delimiting the areas of influence in the High North.

Outlines the treaty of Feb. 9, 1920, granting "full and unrestricted sover-eighty to Norway over the Spitsbergen group, comprising all islands between 10° and 35° E. of Greenwich and between 74° and 81° N. Navigation, fish and wild-life management, travel, trade, wireless and meteorological stations, mining rights and regulations, etc., are included in the treaty. The contracting powers were the United States, Great Britain, Denmark, France, Italy, Japan, Norway, the Netherlands and Sweden.

48454. TRESHNIKOV, ALEKSEĬ FEDOROVICH, and E. I. TOLSTIKOV. Dreffuñshchie stantŝii v tšentral'not Arktike "SevernyI polits-3" i "SevernyI polits-4." Moskva, Izd-vo "Znanie," 1956. 32 p. illus., tables, map. (Vsesofiznoe obshchestvo po rasprostranenifu politicheskikh i nauchnykh znanil, ser. 3, no. 24.) Text in Russian. Title tr.: Drifting stations in the Central Arctic North Pole-3 and North Pole-4.

Activities of the two stations are presented for the period Apr. 1954-Apr. Personnel, setting up the station, building camp, living conditions, summer and winter in tents and prefabricated houses, are reported; supply by airlift, helicopter service, radio communication, visiting guests and scientists are described: the scientific work is outlined and main results are given of the meteorological. aerological, oceanographic, biological and geophysical investigations. Difficulties and dangers caused by melting of ice in summer and by ice pressures and cracks in winter are stressed. Tables of mean, max, and min, monthly air temperatures and of water temperatures to 4.120 m. depth as observed by North Pole-3, are given (p. 13, 18). In its 376-day drift that station traveled 2,200 km. (830 km. net distance); it was abandoned on Apr. 20, 1955 when approx. 300 km. off Concurrently. the Greenland coast. North Pole-4 drifted 2.600 km. (530 km. net distance). The drift of both stations is briefly analyzed. This account is based on popular lectures delivered by the authors, who headed these two stations. It is preceded by a summary of the first four drifting stations (p. 3-6), and a statement on the setting-up of North Pole-5 in 1955 and of North Pole-6 in 1956, also on relief of North Pole-4 and North Pole-5. Map shows drift of the ice-breaker Sedov and of North-Pole-1-4. Copy seen: DLC.

48455. TRESHNIKOV, ALEKSEI FEDOROVICH. God na l'dine; iz dnevnika poliarnika. Moskva, Izd-vo "Morskoi transport," 1956. 94 p. illus., map. Text in Russian. *Title tr.:* One year on the ice; from the diary of a polar worker.

Popular account of drifting station North Pole-3, 1954-1955, by its chief, with excerpts of his diary; recounts the flight over the Arctic Basin, search for a suitable ice floe, setting up the station, and organization of the camp. The arctic summer with the daily work routine, course of the drift, and scientific observations are described. With the fall and winter season, ice cracking and pressures disturbed the camp and forced a transfer of the station to a new site. The coming of spring and evacuation of the station are described. Set up Apr. 10 at 86° N. 175°45′ W., between Vrangelya Island and the North Pole, on Aug. 25, it drifted across the 90° W. meridian 30 km. from the North Pole; when evacuated on Apr. 20, 1955, the station was only 300 km. from Greenland coast. Its equipment was brought home or transferred to the new drift station, North Pole-5. During its 376-day drift, North Pole-3 traveled 2,000+ km. (net distance: 820+ km.). The work of its scientific personnel is described. Oceanographic and meteorological results are summarized. Illus. by E. P. IAtsun, station photographer.

48456. TRESHNIKOV, ALEKSEĬ FEDOROVICH. The Soviet drifting station SP-3, 1954-55. (Polar record, Sept. 1956. v. 8, no. 54, p. 22-29, text

map.)

Account of the station as described in No. 48455 condensed from lecture delivered at the Scott Polar Research Institute, Cambridge, Eng., on Apr. 21, 1956, by Treshnikov, deputy director of the Arctic Institute, Leningrad. (12) are listed; establishment of the station, program of observations, camp life in summer and winter are described. Part of the camp was moved because of cracks in the floe; and the station was relieved Apr. 20 1955, after a drift of 2000+ km., passing within 30 km. of the Pole. Scientific accomplishments are outlined. Copy seen: DLC.

48457. TRESSLER, WILLIS LAT-TANNER, 1903— . Impressions of the Antarctic as compared with the Arctic. [Washington, D. C., U. S. Hydrographic Office.], May 1955. 10 p. Typescript.

During July-Sept. 1954, the author traveled on the icebreaker Burton Island through the Beaufort Sea and southwestern Canadian Arctic Islands waters, reaching 75° N. at Bridport Inlet, Melville Island. From Dec. 1954 to Apr. 1955 he took part in the cruise of the icebreaker Atka to the Antarctic. General

impressions of land and water areas, ice conditions, weather, and animal life are presented. **Copy seen:** DN-HO.

48459. TRICART, JEAN. Étude expérimentale du problème de la gélivation. (Biuletyn peryglacjalny, 1956. nr. 4, p. 285-318, 10 illus., graphs, 2 tables.) 8 refs. Text in French. Title tr.: Experimental study of the problem of gelivation.

A laboratory study of the physical process by which rocks are broken down into loose debris in periglacial regions. Attempt was made to approximate two types of cold climates: Icelandic type of cold maritime climate with many smallrange temperature fluctuations; Siberian cold continental type with longer-lasting fluctuations of much greater range. Methods are described. Gelivation was found to be predominately influenced by environment, rocks in the Icelandic-type climate breaking down more slowly than those under Siberian conditions. Gelivation varied greatly according to the texture of the rocks, their mechanical properties and the landforms of the region. The terms macrogelivation and microgelivation are discussed also the formation of slopes and evolution of relief. Copy seen: DLC.

48460. TRICART, JEAN. Premiers résultats d'expériences de solifluxion périglaciaire. (Académie des Sciences, Paris. Comptes rendus, Jan. 11, 1954. t. 258, no. 2, p. 259-61.) Text in French. Title tr.: First results of experiences of periglacial solifluction.

Describes laboratory experiments of producing solifluction by submitting two 16° slopes to 50 cycles of freezing to

-30° C. and thawing to 10° C. in a humid atmosphere. Comparison is made with the natural phenomenon. The surfaces of the slopes assumed concave profiles with stones on the upper parts of the slopes moving downwards. Greater movement occurred in the lower layers than at the surface, and the loess and silt took on a porous and spongy appearance with a network of cracks apparently related to polygon formation.

**48469.** TROELS-SMITH, J. Nulevende rensdyrjaegere. (Fra Nationalmuseets arbejdsmark 1956, p. 23–40, illus.) Text in Danish. *Title tr:* Present-day caribou hunters.

Contains an account of the life of the Eskimo hunters in the southeastern Barren Grounds (approx. 60°-65° N.) of Canada, based on material in the National Museum in Copenhagen. Details are given on the climate, flora and fauna of the region and on dwellings, tools, hunting methods, etc., of the people (400-500 individuals). The principal game is the caribou, but musk ox, hare, ptarmigan, wolverine, fox, ermine and wolf are also hunted and fishing (salmon) plays an important part. Notes on social life and organization and on religion are included. Copy seen: DLC.

48470. TROELSEN, JOHANNES C., 1913—. The Cambrian of North Greenland and Ellesmere Island. (In: International Geological Congress. 20th, Mexico City, 1956. El sistema Cámbrico, su paleogeografía y el problema de su base: symposium. tomo 1, p. 71–90, 2 text maps, tables.) 23 refs.

Unmetamorphosed sediments below Eo-Cambrian tillite are designated Upper Precambrian (term "Eo-Cambrian" is used, as by C. Poulsen in No. 47438, in sense of early Cambrian). Cambrian and Eo-Cambrian (?) deposits occur in the Thule region and north coast of Inglefield Land in North Greenland, also on Bache (south coast) and Knud Peninsulas on Ellesmere. Stratigraphic succession is described. In Peary Land to the east, Eo-Cambrian formations and older un-

metamorphosed sediments occupy large areas, while fossiliferous Cambrian is exposed only in narrow belts. The Late Precambrian, Eo-Cambrian, and Cambrian (?) of Kronprins Christians Land and inner Danmarks Fjord regions, northeast Greenland are also discussed. Copy seen: DGS

48472. TROITSKAIA, M. N. K metodike opredelenia modula deformasii gruntov zemlanogo polotna. (In: Moskva. Avtomobil'no-dorozhnyl institut. Opredelenie modula deformasii gruntov, 1955. p. 59–68, graphs.) Text in Russian. Title tr.: Method of determination of modulus of deformation of soil in dirt roads.

Design theory of non-rigid road surfaces is discussed on the basis of three basic characteristics related to the modulus of deformation of all road surface materials of different layers, and soils of dirt roads, in addition to critical deflection of surfaces and factors corresponding to repeated loads. Variation of "relative deformation" (ration of deformation to diameter of loaded area) with load, determined in the laboratory and field tests, is expressed by a set of curves and analyzed. Soils of various densities and various degrees of wetness were subjected to the same test. The modulus of deformation of frozen and thawed soils was tested separately using a 30° conical weight and was compared with the standard test. Copy seen: DLC.

48473. TROITSKAIA, VALERIIA ALEKSEEVNA. Dva kolebatel'nykh rezhima élektromagnitnogo polia zemli i ikh sutochnyl khod po mirovomu vremeni. (Akademia nauk SSSR. Doklady, Nov.

11, 1953. t. 93, no. 2, p. 261-64, graphs.) 6 refs. Text in Russian. Translated for Canadian Defence Research Board, no. T174R. Title tr.: Two types of oscillation of the terrestrial electromagnetic field and their daily variations on world time.

The short periodical oscillations of the terrestrial electromagnetic field can be more conveniently studied with records on earth-currents, because the ratio of amplitudes of the electric field to the magnetic one is rapidly increased with reduction of the oscillation periods. Two types of oscillation are generally considered: type I consisting of continuous oscillation during one or more hours with 10 to 40 sec. periodic changes; and type II consisting of short trains of damping oscillations on a background of small steady oscillations (fig. 1). Observations were made simultaneously at widely scattered stations (Irkutsk, Shatsk, Lovozero, Alma-Ata, Sakhalin, etc.). Statistical analysis was applied only to type I oscillation records (fig. 3). Regularity in the appearance and in the time and character of changes and also in hourly distribution of maxima lead to conclusion that the induction of one or another variation in the terrestrial electromagnetic field is determined by the orientation of the magnetic axis of the earth in respect to the sun. Copy seen: DLC.

48474. TROITSKAÑ, VALERIÑA ALE-KSEEVNA. Korotkoperiodieheskie vozmushcheniña élektromagnitnogo polía zemli. (Akademiña nauk SSSR. Doklady, 11 July 1953, t. 91, no. 2, p. 241–44, graphs, diagr., map.) 4 refs. Text in Russian. *Title tr.*: Short, periodical disturbances in the terrestrial electromagnetic field.

Disturbances are usually studied from records of magnetic field oscillation. Periodical disturbances, however, are more distinctly shown in records of earth currents, and for shorter periods of disturbance, the larger amplitudes of earth currents are registered. Both types of the oscillation are shown (fig. 1) and statistically analyzed, together with data from four stations in central Asia. The analysis shows that: (1) trains of oscillation appeared regularly every day independently of disturbances in the terrestrial electromagnetic field; (2) regular occurrences were in the period 12-24 hr. world (Greenwich) time; (3) maximum frequency was usually observed at 18-19 hr.; and (4) trains of oscillations were simultaneously recorded at all four stations. Additional studies conducted during 1951-52 in central Russia, Caucasus, Lovozero, Irkutsk and in central Asia showed the same simultaneous character. The regularity of these disturbances lead to the conclusion that they are timed with the zenith position of the sun over northern magnetic pole. The charged corpuscular stream emitted by the sun focused on the earth's magnetic pole probably is the cause of these regular disturbances.

48484. TSIANG, CHARLES. Greenland's east coast weather stations; an auditor's visit. (United Nations review, Feb. 1956. v. 2, no. 8, p. 10-13, illus.,

Contains a brief illustrated account of the author's visit to Kap Tobin, Aputiteq, and Angmagssalik, in July 1955, while serving as auditor for the International Civil Aviation Organization. Unloading operations at Kap Tobin are described. The location of weather stations on the east coast of Greenland is mapped. The trip was made aboard the Danish ship Jopeter on one of her annual voyages to these stations.

TSIVOL'KA, AVGUST KARLO-48485. 1805?/1807-1839, and S. A. VICH, MOISEEV. Plavanie praporshchikov korpusa flotskikh shturmanov TŠivol'ki i Moiseeva k Novol Zemlíe v 1838 i 1839 godakh. (U. S. S. R. Gidrograficheskil departament. Zapiski, chast' 3, 1845, p. 21-155, fold. map.) Text in Russian. Title tr.: Voyage of Ensigns TSivol'ka and Moiseev, Corps of Naval Navigators, to Novaya Zemlya in the years 1838 and 1839.

Source materials on an expedition organized by the Hydrographic Dept. of the Marine Ministry. It was to complete the work of Pakhtusov (q. v.), who in 1832-35, had succeeded in surveying a part of the eastern coast of Novaya Zemlya, hitherto unknown. On June 15, 1838, the 29-man party headed by TSivol'ka left Arkhangel'sk for the west coast on two vessels, the Novaya Zemlya and Shpitsbergen, with part of their equipment and a prefabricated hut sent by a hunter's boat. After the expedition reached Melkaya Bay (73°57' N. 54°26' E.) and prepared winter camp, TSivol'ka made an attempt to sail northward, but was turned back at Cape Prokof'eva (74°13′ N.55°10′ E.). During the wintering, in March 1839, he died, and the command passed to S. A. Moiseev. Moiseev made a summer survey of the west coast as far north as Mashigina Bay, while his assistants, Rogachev and Kerner, explored Mollera Bay (72°22′ N. 52°30′ E.), Kostin Shar Strait and vicinity down to Cape Chernyy (70°50′ N. 53°25′ E.). On Sept. 8, 1839, Moiseev on the Shpisbergen returned to Arkhangel'sk; the Novaya Zemlya under command of Rogachev was wrecked en route in Lumbovskiy Bay (67°47′ N. 40°25′ E.) at the entrance to the White Sea, and its crew rescued by hunters.

crew rescued by hunters.

The materials comprise

The materials comprise: a summary of previous expeditions' results and instructions for TSivol'ka; text of Moiseev's diary from departure till his return to Arkhangel'sk, June 15, 1838—Sept. 8, 1839, (p. 42–121). Results of the expedition are summarized and a hydrographic description of Novaya Zemlya is given by the editor, M. F. Reineke? (p. 122–55), on the basis of the journals of TSivol'ka, Moiseev and others. Two fold. maps (at end of vol.) show the expedition's route and delineate the coast of the northern island. Moiseev's diary with appendices is reprinted in No. 47229.

48486. TŠIVOL'KA, AVGUST KARLO-VICH, 1805?/1807-1839. Plavanie praporshchika TŠivol'ki s akademikom Bėrom k Novol Zemlie v 1837 godu. (U. S. S. R. Gidrograficheskil departament. Zapiski, chast' 3, 1845, p. 1-20.) Text in Russian. Title tr.: Voyage of Ensign TŠivol'ka with Academician Baer

to Novaya Zemlya in 1837.

Account of the first Novaya Zemlya expedition of the Academy of Sciences. Headed by K. E. Baer, the party left Arkhangel'sk June 17, 1837 on the Krotov and Sv. Eliset, encountered adverse winds and reached Novaya Zemlya on July 19. Botanical and zoological explorations were made in the coastal regions from Matochkin Shar to Kostin Shar straits, and on Sept. 11 the party returned home. This account is based on the notes of TSivol'ka, who was responsible for navigation and the hydrographic observations, and on quotations from reports of Baer, a noted naturalist (cf. No. 913-915 of Arctic Bibliography). Copy seen: DLC.

The Angara River, bound by its geographical situation to become the main waterway from Western to Eastern Siberia, is obstructed by the Padunskiy Rapids, at approx. 56°17′ N. 101°50′ E. New hydroelectric installations are to raise the water level, "drown" the rapids, and thus solve the navigability problem.

A new method of thawing frozen ground is described. Infra-red lamps in series or special heating coils were successfully used. The heating device, consuming 9 kw., produced temperatures of about 750° C. around the coils. Placed 7 cm. from the surface, it increased the temperature to 15° C. to a depth of 25 cm. in three hours; and if the thawed ground is removed every 20 minutes, the total depth thawed is 90 cm. Air temperature was about -30° C. Copy seen: DLC.

48492. TUCKER, JOHN T. Mobility problems of the Navy in the Arctic. (In: U. S. Office of Ordnance Research. Interservice Vehicle Mobility Symposium, 18–20 Apr. 1955. v. 2, Papers, p. 102–109,

7 illus. diagr., map.)

Limitations imposed on arctic overland operations by climate and weather are described on the basis of operations 1944-1954 at Naval Petroleum Reserve No. 4, Point Barrow, Northern Alaska; and the need for special equipment and new procedures is discussed. Many of the mobility problems are due to mechanical failures but during the transition seasons of the year, overland transport into the interior of the Arctic ceases. The U.S. Navy is building a tundra truck for use in the Arctic on a year-round basis. The vehicle measures  $36\frac{1}{2} \times 12\frac{3}{4} \times 1$ 9 ft. and weighs 47,500 lb. with a design payload of 7.5 tons. Power will be supplied to two 60-in. rubber-belted tracks by the gas turbines. This vehicle and other equipment are illustrated (photos). A composite ice chart for the Northern Hemisphere is presented, showing mean limits of the polar pack, sea and land ice occasionally penetrable by icebreakers, area navigable with icebreaker assistance, and permafrost. Copy seen: DLC.

48493. TUGOLUKOV, V. A. Poezdka k okhotskim ėvenkam i ėvenam. (Sovetskaia ėtnografiia, 1956, no. 3, p. 142–46.) 4 refs. Text in Russian. *Title tr.:* A trip to the Okhotsk Evenki and Eveny. Describes author's summer-fall 1955 trip, sponsored by the Commission on Problems of the North and organized by the Academy of Sciences U. S. S. R. Institute of Ethnology (also noted ibid. 1956, no. 2, p. 133). He traveled to the Tuguro-Chuminsk, Ayano-Maysk, Okhotsk rayons of Khabarovskiy Kray to study the economy, culture and customs of the Evenki (Tungus) and Eveny (Lamuts). Data for 1954-1955 on population, collective farms, reindeer herds, etc., are given. Marriage customs, schools, housing, ethnic origin, Yakut influence in language and administration are discussed. Agricultural and fishing kolkhozes in Udskoye, Algazeya, Totta, Urak and Okhotsk were visited, those in the talga mainly Tungus, and on the coast predominantly Russian. Insufficient housing is criticized; increase of reindeer herding is suggested.

48494. TUMEL', VAŤŠLAV FELIKSO-VICH, 1905— Igarskoe opytnoe podzemel'e v vechnomerzloĭ tolshche. Moskva, Izd-vo Akademii nauk SSSR, 1945. 80 p. illus. diagrs. (Akademiiā nauk SSSR. Institut merzlotovedeniiā.) 12 refs. Text in Russian. *Titte tr:* Experimental caves in the permafrost at Igarka. Previously listed as No. 18079.

The construction of two experimental caves and results of investigations carried out are described, and data are tabulated and graphed. The caves, 22 cu. m. and 468 cu. m. in volume, were constructed during 1936-1942 under the supervision of the Institute of Permafrostology. Permafrost in the region reaches depths of 30-35 m.; the active layer is 1.8-2.2 m. thick; and the ice content in the frozen ground averages about 38 percent. Annual soil temperatures at a depth of 0.5 m. during the period 1937-1941 ranged from 0.7° to 1.0° C. under natural surface cover and from -3.7° to -7.6° C. under a bare ground surface, while at a depth of 10 m. average soil temperatures were -0.3° to -0.6° C. The smaller cave was constructed for research on architectural problems and the study of frozen ground as a building material. The experiments showed that the problem of permafrost degradation in the vicinity of buildings can be solved easily, even in an area where the mean annual permafrost temperature is about 0.5° C. An artificial ice cover 5-10 cm. thick on the cave walls was sufficient to prevent desiccation of the frozen ground, and evaporation from the ice cover was an additional source of cooling. Such caves were used for food storage at Anadyr', Ust'-Port on the Yenisey, Kyusyur on the Lena, Khatanga, etc. Special tests were conducted on storage of books and manuscripts, particularly on the effect of moisture.

On the western scarp of Dolly Ridge, a NNW-SSE trending ridge near Knob Lake, there occur several valleys of alcove-like morphology. They are never occupied by running water and their development must therefore be attributed to some other agency. It is suggested that these valleys are comparable with the "ravins de gélivation" reported by Boyé from Greenland (see No. 20857): they are believed to be formed essentially by the widening of major structural lines by gelifraction. The weathered material is evacuated by solifluxion and there is some evidence to suggest that these solifluxional flows may be capable of erosion. Copy seen: DGS.

**48504. TYRTIKOV, A. P.** O vlifanii rastitel'nosti na mnogoletnemerzlufu podpochvu. (*In:* Akademifa nauk SSSR.

Institut merzlotovedenifa. Materialy k osnovam uchenifa o merzlykh zonakh zemnol kory, 1956. vyp. 3, p. 85–108, tables.) 29 refs. Text in Russian. Title tr.: Influence of vegetation on permafrost in the subsoil.

Vegetation effects on soil moisture and temperature and the depth of the active layer are analyzed on the basis of observations in Yakutia and other Siberian regions in 1950-1952 as well as earlier investigations. Data on summer soil temperature and depth of soil thawing under various kinds of vegetation are given in 13 tables. The thermal effects of the vegetation cover on permafrost ground vary not only with the character of the vegetation, the thickness and density of the cover, but also with general climatic and topographic conditions. Disappearance of the vegetation cover leads to melting of ground ice and formation of large lakes, marshes, lowlands, ravines, cave-ins, craters and similar thermokarstic forms of relief.

48507. UDINTSEV, G. B. O rel'efe kurilo-Kamchatskoi vpadiny. (Akademiña nauk SSSR. Sovet po seismologii. Bûlleten', 1956. no. 2, Sbornik statet po fsunami, p. 35–42.) Text in Russian. Title tr.: The contour of the Kuril-

Kamchatka depression.

The arch of the Pacific Ocean deeps, including the Kuril Trench, is analyzed in relation to a seismic belt. The appearance of tsunamis, or seismic ocean waves, has been connected over a long period with disturbances in this belt and with the arch of deeps. Of the tsunamis observed, 86 percent have been in the Pacific Ocean, 8 percent in the Atlantic; they have been related, by geological investigations, with zones of great depths, and underwater volcanic eruption, or rupture and massive rock slide on steep slopes. The Kuril Trench was surveyed by the Academy of Sciences' research vessel Vitiaz' in 1953 and a maximum depth of 10,382 m. located 180 km. south of the Friz (or Vries) Strait, which gradually diminished to 6,500 m. toward the Commander Islands. This zone, of high seismic activity, is being studied for correlation of specific activity with appearance of tsunami.

48509. UDVARDY, MIKLOS D. F. Observations on the habitat and territory of the chaffinch, Fringilla c. coelebs L., in Swedish Lapland. (Arkiv för zoologi, Dec. 15, 1956. bd. 9, no. 24, p. 499–505, text map.) 25 refs.

During an excursion of the 10th International Ornithological Congress in the vicinity of Kiruna (67°55' N. 20°50' E.) in summer 1950, the habitat preference of the chaffinch and its relationship to the brambling (Fringilla montifringilla) were studied. The territories of the scarce chaffinch population sometimes overlap with those of the brambling, but no sign of interspecific intolerance or competition was noticed. The advance of the chaffinch and the regression of the brambling in southern and central Lapland are seen as results, ultimately of the amelioration of the climate.

Col. map in 32 sheets, with index map in envelope. Text in Russian. Title tr.: Map of forests of the U. S. S. R., scale 1:2,500,000. F. M. Kozlov and V. P. Tšeplfaev, editors.

The map is based on data collected by Main Administration of Forestry of the Ministry of Agriculture of the U. S. S. R. Types of forests and unforested areas, including tundras, are distinguished by color and conventional signs, explained in legends on each sheet and (cumulated) on sheet 25 also index map, scale 1:15,000,000. Arctic and subarctic areas are shown on sheets 3 (Kola Peninsula), 4-7 (arctic tundra regions), 8 (Chutkotka and Anadyr' River basin), 11 (Arkhangel'sk Province), 12 and 13 (Omsk and Krasnovarsk Provinces), 14 and 15 (Yakut A. S. S. R.) and 16 (Kamchatka). Tundra and thin forest tundra predominate in the arctic regions, with forest intrusions beyond the Arctic Circle on Kola Peninsula (pine, spruce and birch) and in Yakut A. S. S. R. (larch). U. S. S. R. GLAVNOE UPRAVLENIE GIDROMETEOROLOG I CHESKO I SLUZHBY, see Khromov, S. P. Sinopticheskie profsessy Dal'nego Vostoka. 1940. No. 45971.

48513. U. S. S. R. KOMITET PO PRO-VEDENIÑ 2-go MEZHDUNAROD-NOGO POLÍARNOGO GODA. Gidrologicheskie nablûdeniña morskikh ékspeditsil 2-go MPG 1932-1933 g., vyp. 1: Obshehie svedeniña o rabotakh morskikh ékspeditsil. Pod redaktsiel I. A. Kireeva. Leningrad-Moskva, Gidrometeorol. izd-vo, 1937. 86 p. 33 maps (part fold.) Text in Russian and in English. Title tr.: Hydrological observations of the sea expeditions of the Second International Polar Year, 1932-1933, part 1, General information on the work of the sea expeditions. I. A. Kireev, Editor.

Purpose and scope of the Soviet oceanographic investigations are outlined in an introduction by N. N. Zubov (p. 7-15 and 49-56), who states the objectives of the Second International Polar Year generally, and their relation to achieve-ments of the First Year, 1882-83. In the Second, unlike the First, ice conditions were favorable for oceanographic work. Soviet vessels made 26 oceanographic research trips altogether, in waters between Greenland and Bering Seas. Each is mapped (route and stations), and each in turn is briefly described in Russian (p. 16-48) and English (p. 57-85): its purpose, area, personnel, vessel, equipment, and methods, length of trip (in general and in ice), and number of stations; kinds of observations and collections made are stated. The scientific results were published as pt. 2-7 of this work: pt. 4-5 and 6-7 on the Kara-Laptey, and the East Siberian-Chukchi-Bering Seas were listed as No. 8722 and 8728 of this Bibliography. Pt. 2-3, results of the Perset and Knipovich investigations in Greenland and Barents Seas, have not been seen.

48514. U. S. S. R. MINISTERSTVO STROITEL'STVA. TEKHNICHE-SKOE UPRAVLENIE. Tekhnologicheskie pravila proizvodstva shlakobetonnykh stenovykh kamnet,  $\frac{TP-1-53}{MSPTI}$ . Moskva, Gos. izd-vo literatury po stroitel'stvu i arkhitekture, 1953. 116 p. tables, diagrs., graphs. Text in Russian. *Title tr.:* Technological regulations for the preparation of slag-concrete wall blocks, TP-1-53 MSPTI'

Lightweight, frost- and heat-resistant slag-concrete blocks have been widely adopted for wall construction in buildings. Standards and regulations on their use have been developed by the joint scientific research organization and approved by the Technical Administration of the Ministry on Building of Heavy Industry. These regulations cover the selection of production methods, specifications for basic materials and mixture components, etc., for various types of

blocks. Preparation, processes and general thermal conditions required, also thermal treatment (steaming) for rapid setting and hardening are dealt with. Appendix contains supplemental information on local regulations; tabulation of block characteristics; test regulation for component parts; computation of mixture composition; etc.; information on details. Copy seen: DLC.

Isakov; glav. redaktor L. A. Demin. [Moskva-Lenin-Morskogo general'nogo grad] Izd. shtaba, 1950-1953, in progress.

v. 1 in 2 pt.: pt. 1, pub. 1950: xv p., 83 double-page col. maps; pt. 2, pub.

1952: xiv, 543 p.

v. 2, pub. 1953: xviii, 5 p. 76 doublepage col. maps and graphs. Legend ("uslovnye oboznachenifa"), 1 leaf for each volume, is laid in. Text in Russian. Title tr.: Marine atlas. Vol. 1, Navigational-geographic; Index of geographic names. Vol. 2, Physical-geographic. I. S. Isakov, editor-in-chief; L. A. Demin, main editor.

The purpose and scope of this atlas are summarized in the preface to v. 1 (p. ix) as a fundamental, cartographic compendium of geography of the oceans and seas, intended, primarily as a reference book for scientific institutions, staffs, academies and officers of the Soviet Army and Navy. Also, it is to be a guide for captains and navigators of the marine commercial and trade fleet, for party and scientific workers, and for students of higher schools who are concerned with geography of seas. The work, initiated in 1941, but delayed by the World War, is planned in three volumes, the last, Military-political (Voenno-politicheskii), pub. in two parts, 1957-1958, will be described in vol. 9 of Arctic Bibliography.

Vol. 1 deals with general characteristics of the oceans, seas, straits, bays, island groups, harbors, and regions of importance to navigation. The maps of this volume are of five main classes: (1) synoptic maps ("obzornye karty") of oceans, in scales 1:30 to 15 millions; (2) synoptic maps of seas, 1:10 to 5 millions; (3) general maps ("general'nye karty") of seas, 1:5 to 3 millions; (4) maps of maritime regions, 1:2,000,000

1:250,000; (5) plans of ports and naval bases, 1:200,000 to 1:100,000. The 83 map sheets in this volume cover all oceans and seas of the world, including the Arctic Basin, Barents, White, Kara, Laptev, East Siberian, and Chukchi Seas, the northern coasts of Scandinavia, arctic seas and waters of the Western Hemisphere (sheets 2, 3, 5, 8-13) and northern seas of the Far East, viz. Okhotsk and Bering Seas, the Northwestern Pacific, Gulf of Alaska and Aleutian waters (sheets 62, 65-69). The second part of this volume (p. 1-489) presents an index of approx. 120,000 geographic names on its maps. The listing, in Russian or (for most of non-Russian names) in Latin transcription. includes geographic coordinates as well as map references. Indexing methods, abbreviations, etc., are given (p. vi-xiv) as well as a glossary (p. 493-539) of 96 geographic generic terms in 25 main languages.

Vol. 2 deals with principal voyages and expeditions (map sheets 1-6); oceanography (7-40); climate (41-69); and terrestrial magnetism, cartography and astronomy (sheets 70-76). Names, dates and routes of the main Russian and some non-Russian arctic expeditions are included on map sheets 1-6. Cartographic and graphic data on bathymetry, climate, fauna, flora and magnetism of arctic seas are noted on maps referring to: ocean bottoms (sheets 7-9), limits of polar ice in March and August (25), distribution of pinnipeds, marine fishes, birds and algae (39-40), air temperature, atmospheric pressure, wind, atmospheric circulation, climatic zones and precipitation (42-49), terrestrial magnetism (70-71) and on graphs of sunrise, sunset and the length of twilight for various latitudes (74-75). Appended (5 p.) is index of over 2000 names and terms in this volume. Copy seen: DLC.

48516. U. S. AERONAUTICAL CHART & INFORMATION CENTER, St. Louis. U. S. Air Force-U. S. Navy pilot's handbook: instrument approach procedure charts, low altitude. v. 3, North Atlantic and East Canada. St. Louis, Mo., 1956. 175 p. charts, maps, tables.

Contains instrument approach and letdown procedures for use in this area. Charts and information are included for aerodromes at Alert, Churchill, Coral Harbour, Eureka, Frobisher, Gander, Goose Bay, Great Whale River, Knob

Lake, Narsarssuak, Nord, Padloping, Pond Inlet, Resolute, River Clyde, and Sondrestrom. Copy seen: DLC.

Field tests were conducted near Ladd Field, Alaska, during the 1943-44 winter. Two test groups simulated a forced landing and a third group an emergency parachute jump. Temperatures during the tests ranged from  $-48^{\circ}$  to  $-13^{\circ}$  F. The equipment tested was standard emergency equipment carried in multiengined aircraft. An outline of the test program, photographs, sample sheets, lists of equipment contained in the kits and in heavy aircraft, and temperature records are included. The versatility of the parachute in emergency survival practices is noted; and parachutes with bright colored canopies are recommended as standard issue for arctic operations. Copy seen: AMAU.

48518. U. S. AIR FORCE. AIR PROV-ING GROUND COMMAND. Eglin Air Force Base, Fla. Consolidated unsatisfactory report on informal observations of aircraft and equipment used by the Cold Weather Detachment during the winter test season of 1946 and 1947 at Ladd Field, Alaska. Eglin Field, Fla., Apr. 28, 1947. 41 l. Typescript.

Deficiencies noted in cold weather operation of aircraft, vehicles, auxiliary equipment, and component parts are given in detail, and suggested improvements are listed. Particular emphasis is given to results of flight and taxi tests of B-29 aircraft at Ladd Field, and a discussion of operating characteristics of the weasel in cold, snow areas. Nearly all major equipment considered (except the weasel) was unsatisfactory for arctic use unless major improvements were made.

48519. U. S. AIR FORCE. AIR PROV-ING GROUND COMMAND. Eglin Air Force Base, Fla. Meteorological station, portable, AN/TMQ-1 (XO-2) cold weather test. Eglin Field, Fla., May 4, 1945. 49 p. incl. 28 photos. (Report of the Army Air Forces Board, project no. 4449C413.6.) Field tests were conducted at Livengood, Alaska, during the 1944-45 winter to determine functional suitability of the station with respect to design, construction, and performance at low temperatures. All equipment necessary for highly mobile field operations is included in the portable station, such as barometers, thermometers, wind equipment, balloon-inflating equipment, precipitation gage, ceiling light projector, etc. The station was found unsatisfactory for low temperature operation. Recommendations are given for increasing the suitability.

48520. U. S. AIR FORCE. AIR PROV-ING GROUND COMMAND. Eglin Air Force Base, Fla. Operational suitability test of building, precut weather station, hydrogen generator and balloon shelter. Eglin Air Force Base, Fla., Apr. 6, 1951. 41 p. illus. (Its: Project no. APG/SSB/ 43-C).

The precut building was erected and tested at Big Delta, Alaska, during the 1950-51 winter. The building was designed by the Corps of Engineers to serve as a shelter for preparing and launching balloons for rawinsonde operations. The structure is 20 ft. high with outside dimensions of 15 x 33 ft. Difficulties in erecting it and the necessity of augmenting materials from a local source make the building operationally unsuitable for Air Force use in the Arctic.

Comprehensive compilation of weather and climatic data for the American, European, and Asiatic arctic and sub-artic areas, Greenland, and the Arctic Ocean and adjacent seas. Part I includes a general description of the properties and movements of arctic air masses as well as the frequency of cyclonic storms in the area. Cyclone tracks for selected months are mapped, and representative synoptic situations are presented. Considerable data are included on surface and upper winds in the polar area. Part II presents detailed descriptions of particular weather elements, including visibility, illumination, icing, fog, temperature, and cloudiness. Data are included on occurrence and duration of snow cover. A brief ice glossary is given together with information from Russian sources on landing aircraft on ice. Part III consists largely of frequency data on occurrence of various visibility limits for different months, ceiling heights, and various weather phenomena.

48522. U. S. AIR FORCE. AIR WEATHER SERVICE. Forecasting summer fog at Thule, Greenland. June 1953. 18 1. 20 maps & diagrs. (Its. 8th Weather Squadron Technical memo. no. 2.) Photostat.

One year's data were utilized to establish objective criteria for forecasting fog which presents the greatest hazard to flight operations in the area during the summer months. Scatter diagrams of various meteorological parameters are shown and analyzed. Surface temperature was found to be the most significant criterion with critical values of 30° F. in June, 35° F. in July, and 40° F. in August. Surface winds must have a northerly and westerly component for fog formation. The 1000-700 mb. thickness value is of some value in July as fog generally occurs only below the critical value of 9300 ft. Copy seen: AMAU.

48523. U. S. AIR FORCE. AIR WEATH-ER SERVICE. History of the 58th Weather Reconnaissance Squadron, July 1-Dec. 31, 1954; prepared for the historical office . . . by Capt. Jerrold L. Hastings. Eielson Air Force Base, Alaska, 1954. 10 p.l., 293 p. typescript,

photos., diagrs., tables, maps.

Section I (p. 1-141) contains a detailed discussion of the organization and accomplishments of the 58th Weather Reconnaissance Squadron, based at Eielson Air Force Base, Alaska. Operations and training, maintenance, supply, intelligence, and personnel and services are described. A detailed account of a simulated survival training exercise by a crew of 11 men on Dec. 6, 1954 is included (p. 117-41). Section II (p. 142-85) contains photographs of the squadron in general, and of the arctic survival exercise. Section III (p. 186-213) contains charts and graphs showing flight statistics, personnel assignments, and data relevant to the various missions flown. Appended (p. 214-93) are copies of correspondence, letters of appreciation, news clippings, copies of programs of social activities, reprints of papers or publications presented by members of the Squadron, and a summary history of the Squadron from Dec. 7, 1945 including flight statistics and maps showing tracks flown.

48524. U. S. AIR FORCE. AIR WEATH-ER SERVICE. Studies on local forecasting: Coral Harbor, S. I., Keewatin, Canada: pt. 1, first study, circa Oct. 1943 from "Studies on local forecasting as submitted by stations within 16th weather region"; pt. 2, Hq., AAF Weather Division report no. 500-52, July 1944; pt. 3, revised study, circa July 1944. [Washington, D. C.] 1944. 4, iv, 5, 7 l. diagrs., tables, maps. Prepared by J. F. Pasilis, G. M. Lee, and D. F. Hartman.

General climatic conditions and objective forecasting rules are presented for this station located on the south coast of Southampton Island at 64°11′ N. and 83°21′ W. Orographic effects are minimal, but a land and sea breeze effect is marked during the summer. Little is known about autumn conditions. A normal frequency table of ceiling, visibility, and precipitation conditions and a wind rose for the period Oct.—May are included, also a topographic map of the island.

\*\*Copy seen: DWB.\*\*

48525. U. S. AIR FORCE. AIR WEATH-ER SERVICE. Studies on local forecasting: Cordova, Alaska. 1. First study, 30 September 1943, from "Preliminary compilation of forecasting aids," 11th Weather Region. Washington, D. C., Andrews Air Force Base [1943]. 4 1. tables.

A meteorological summary is given for this station located at 60°32′ N. 145°42′ W. Temperature and precipitation data are based on lengths of record varying from 22–28 years. Data on cloud cover and visibility are also included. The topography of the area and brief empirical forecasting rules are given.

Copy seen: DWB.

48526. U. S. AIR FORCE. AIR WEATH-ER SERVICE. Studies on local forecasting; Shemya Island, Alaska; pt. 1, first study, 9 September 1943, reprinted as Hq. AAF, Weather Division report no. 600-59, July 1944; pt. 2, study from "Local weather conditions in Alaska", 11th Weather Region, 30 June 1944. Washington, D. C., 1944. 11; iv, 11 1. diagrs., map, tables.

Tentative objective forecasting rules are summarized for this island. Located at 52°47′ N. and 174°15′ E. it is approx. 2 x 4 mi. in extent; orographic influences

are negligible. Fog is the chief hazard to flying in the summer months. Forecasting difficulties arise due to the lack of weather data for stations to the west. A topographic map of the island is included.

Typescript.

The initial planning, actual operations, and difficulties of airlifting supplies and equipment to DEW Line construction sites in Apr.-May 1955 are described in detail. Major difficulties included lack of time for planning, a shortage of skiequipped airplanes, and poor landing facilities. General spring weather conditions in the Canadian Arctic are summarized, and mean meteorological data are given for 15 selected stations. mulas are given for estimating thickness of fresh-water and sea ice and required ice thickness for landings of C-124 aircraft. Data on daily operations and overall accomplishments are tabulated.

**48531. U. S. AIR FORCE. NORTH- EAST COMMAND.** Exercise "Arctic Night", final report. 1956. iii, 42 p. diagrs., tables, maps, 24 photos.

This joint Army-Air Force training exercise was conducted at Thule Air Force Base, Mar. 14–15, 1956, to determine the feasibility of military operations by airborne troops in the Arctic. Illustrations of some of the equipment employed and the environmental conditions encountered are included. Climatological data for March are presented together with the forecast and actual weather conditions. The basic exercise objectives were accomplished without difficulty. The major shortcomings noted were the need for more adequate camouflage, improved ski training for troops, and more suitable aircraft.

48534. U. S. ALASKA RAILROAD COMMISSION. Railway routes in Alaska. Message from the President of the United States transmitting report of Alaska Railroad Commission. Washington, D. C., U. S. Govt. Print. Off., 1913. 172 p. 24 fold. maps (16 in pocket), 3 fold. profiles (in pocket), tables. (U. S. 62d Congress, 3d sess. House document no.

1346.) Approx. 170 refs.

Contains message of President Taft regarding the appointment of the fourman Commission (J. J. Morrow, A. H. Brooks, L. M. Cox, C. M. Ingersoll) and a summary of the Commission's findings. Then follows the report, dealing first with the organization and field work of the Commission, its itinerary; existing transportation routes, climate of central and southern Alaska, natural resources, population, and commerce. Existing and proposed railway routes are discussed with regard to resources and markets of area to be served, general geology, topography, and drainage, and their relation to construction: White Pass and Yukon Railway, Haines-Fairbanks route, Katalla and Controller Bay coal route, Cordova-Fairbanks route, Valdez-Fairbanks route, Seward-Fairbanks route, Iliamna-Kuskokwim route. The harbors and settlements of Skagway, Haines and Pyramid, Katalla, Controller Bay, Cordova, Valdez, Seward, and four harbors in Cook Inlet are briefly considered. Estimates are presented for construction costs of railroads and branch lines under consideration; also an analysis of operation costs on all routes. Markets for Alaska coal are briefly discussed. Conclusions and recommendations are presented. Appendices list equipment and machinery available for transfer from the Panama Canal; statistics of commerce and industry in Alaska: notes on Canadian railroad work; publications (including maps) relating to transportation and railway routes in Alaska.

Folded strip maps in pocket (scale 1:250,000, contour interval 200 ft.) cover by sections the Haines-Fairbanks Route, the Cordova-Valdez-Fairbanks Routes, the Seward-Fairbanks Route, the Seward-Iditarod-Innoko Route, and the Iliamna-Kuskokwim Route. Features (rivers, lakes, glaciers, settlements) and topography are shown in the region immediately adjoining the route. Maps are based on U. S. Geological Survey topographic maps. Long profiles are also presented showing altitudes of the Cordova-Fairbanks Route, the Valdez-Fairbanks Route and Seward-Fairbanks Route and some of the branch lines. Maps and profiles are based mainly on U.S. Geological Survey Copy seen: DGS.

48535. U. S. ARCTIC, DESERT, TROP-IC INFORMATION CENTER. The use of ice for aircraft landing strips. Maxwell Air Force Base, Ala., Research studies Institute, Air University, 1955.

17 l. (Project 572.)

An ice survey field team was organized to inspect and pass on the suitability of proposed landing strips on sea ice for C-124 aircraft operations in support of DEW Line activities in arctic Canada. A brief review is given of published data on ice strength, and some results of actual landings on ice are described. The results of the survey indicated that scientific data on the bearing capacity of ice are incomplete, that more trained personnel for studying and testing ice are needed, and that ice has an important potential use in cold-weather military operations. Problems encountered during the survey are discussed.

48536. U. S. ARMY. ALASKAN COM-MAND. Exercise Snowbird; final report. [Fort Richardson? Headquarters, U. S. Army, Alaska, Office of the Commanding General.] 1955. iii, 14 p.

maps, diagrs.

-

ì

Contains a general summary of the joint U. S. Army-Air Force exercise conducted in the Talkeetna-Caswell area of subarctic Alaska, Jan. 10-Feb. 10, 1955. A mass parachute drop was made by an airborne regimental combat team, into snow 24-30 in. deep, with fewer injuries than expected. A snow airstrip adequate for landing cargo-type aircraft was constructed under simulated combat conditions. An infantry regimental combat team marched 55 mi. over difficult terrain in snow averaging 30 in. deep. Ice bridges, capable of supporting M-41 tanks were constructed.

Copy seen: DLC.

48537. U. S. ARMY. CONTINENTAL ARMY COMMAND. ARCTIC TEST BRANCH. Report of Arctic Test Branch, Big Delta, Alaska. Project Nr AB 1654 (Arctic): arctic testing of methods of parachute delivery of individual and crew-served infantry weapons and equipment, including the rucksack. (DA Proj Nr 7-87-03-001; RDB Tech Obj AL-3). Ft. Monroe, Va., Mar. 15, 1955. [77] p. fold. map, 28 photos, tables. Process print.

Details of the study and test results are given of parachute delivery of infantry weapons and equipment designed for airborne combat teams and conducted near Big Delta, Alaska, Nov. 28, 1954-Jan. 10, 1955. Equipment included in the test is illustrated. Deficiencies noted and suggested modifications to the equipment and method of delivery are listed. Map shows southern limits of the Arctic and sub-Arctic, coniferous forest limit, winter warfare limit (zone requiring some modification for sustained combat in winter), and the wind-chill line (isoline of cooling at the rate of 1,100 Kcal./sq. m. hr. for January in the Northern Hemisphere.

Copy seen: AMAU.

48538. U. S. ARMY. CONTINENTAL ARMY COMMAND. ARCTIC TEST BRANCH. Report of Arctic Test Branch, Big Delta, Alaska. Project Nr AB 2353 (Arctic): Arctic test of aerial delivery kit for truck, cargo, 2½ ton, 6 x 6, M35. (DA Proj 87-03-001; RDB Tech Obj AL-3.) Ft. Monroe, Va., May 5, 1955. 17 p. 5 photos. Process print.

Materials required to prepare the truck for parachute dropping were tested under arctic conditions. The truck was successfully dropped five times on frozen ground and compacted snow from C-119 aircraft flying at 1,500 ft., by utilizing a cluster of five parachutes. The equipment before and after drop is illustrated. The kit was determined suitable for use in the Arctic.

\*\*Copy seen: AMAU.\*\*

48539. U. S. ARMY. CORPS OF ENGINEERS. Depth of snow cover in the Northern Hemisphere. Prepared by Arctic Construction and Frost Effects Laboratory, New England Division, for Office of the Chief of Engineers, Airfields Branch, Engineering Division, Military Construction. Boston, June 1954. 2 p. l., 4 l. table on 14 l., 38 plates (part. col.maps, diagrs.). (Its: Investigation of construction and maintenance of airdromes on ice, fiscal year 1954.) 80 refs.

Snow depths are depicted on a broad scale with no attempt to present local Data from 511 stations are tabulated. Station location and elevation are included along with the period and number of years of record. Stations listed include 13 for Alaska, 105 for Canada, five for Greenland, as well as several in Scandinavia and the Russian Arctic. Snow-depth values given for each month include the arithmetical mean, maximum, minimum, secondhighest observation and median. Monthly snow-cover maps from Oct. 31-May 31 are given for the mean, max. and min. snow depths. Frequency curves of various depths of snow are plotted for 312 individual stations. Copy seen: DLC.

48540. U. S. ARMY. CORPS OF ENGINEERS. Investigation of snow compaction methods and equipment, conducted for Engineer Research and Development Laboratories fiscal year 1949. Tables, drawings & photographs, descriptions of specialized procedures, plan of test. Boston, Soils Foundation and Frost Effects Laboratory, Corps of Engineers, U. S. Army, New England Division, June 1949. 11, 23 p. 18 tables, 156 plates (illus., charts, diagrs. incl. 19 fold., maps).

"Tests conducted at the Limestone Air Force Base, Limestone, (Maine) during the winter of 1948–1949, and results obtained with conclusions and recommendations, are presented. Full scale tests were performed to measure effectiveness of various types of compaction and steam injection apparatus and to examine the effect of repeated breaking up and

recompaction of the snow. Scale model pontons were used to study effects of individual variables on compaction results. Additional studies covered static laboratory compaction, California bearing ratio, modules of elasticity, and photomicrography. Snow densities up to about 0.5 gm/cm3 were easily obtained with modifications of commonly available compaction equipment. It is concluded that steam can not be effectively mixed with snow unless the snow is mechanically dispersed. Upper limits of bearing value of compacted snow, as represented by tests on pure ice, are shown to be of the order of several hundred percent California bearing ratio."-SIPRE.

48541. U. S. ARMY. CORPS OF ENGINEERS. Trafficability of snow; report no. 2, Greenland studies 1954. Vicksburg, Miss., Waterways Experiment Station, Aug. 1955. iv, 155 p. diagrs., illus., map, tables. (Its: Technical memorandum no. 3–414.)

An account is given of tests with wheeled and tracked vehicles as well as towed sleds with snow conditions of a melt zone at Thule Take-off (Tuto, an ice ramp approx. 14 mi. southeast of Thule), a dry zone at Sierra (a temporary camp site located at 77°14' N. 62°20' W.), and a transition zone at Nuna Take-Off (Nuto, an ice ramp approx. 40 mi. northeast of Thule). The relatively narrow range of snow conditions tested precluded establishment of limiting snow conditions for the vehicles tested. The primary obstacles to vehicle mobility on the icecap seem to be the ramp slopes and crevasses. It is recommended that trafficability studies be continued, particularly on soft, loose snow and that criterion to define snow as passable should be 10-15 passes rather than 40-50 used on soils. The snow classification system used and the mechanical characteristics of Sierra snow are appended. Copy seen: AMAU.

48542. U. S. ARMY. CORPS OF ENGINEERS. ARCTIC CONSTRUCTION AND FROST EFFECTS LABORATORY. Approach roads, Greenland 1954 program, projects 1 and 10A. Boston, Mass., May 1956. 2 p. 1., 36 p. illus., diagrs., graphs, maps, tables. (11s: Technical report no. 64.)

Results are reported of field studies from June-Sept. 1954 near Thule on methods and techniques for the construction and maintenance of roads on bouldery, permafrost terrain as well as gravel-filled roads on ice surfaces of the glacial type. The site was between a point on the existing "P" Mountain Road approx. ten road miles from Thule Air Force Base and a point on the smooth ice ramp approximately 11 miles southeast of the base near Thule Take-off (TUTO). It is indicated that the normal cross section of roads on ice-free terrain should be a fill, the depth of which should meet the requirements for adequate drainage, snowdrift control, and loadsupporting capacity; cuts should be avoided. Roads of satisfactory bearing capacity may be constructed on the icecap ramp parallel to the lines of surface drainage; but some danger to road stability may result after several thaw seasons unless protective measures are taken. Data are tabulated and graphed on soil characteristics, water content and densities of undisturbed frozen soils and thawed soils, average daily temperatures and thawing indexes, the relation between thawing indexes and elevation, thaw penetration and degree-days of frost, subsurface temperatures, the influence of fill depth on thaw depth in subgrades, and ice-surface melt beneath various depths of gravel fill. 48543. U. S. ARMY. CORPS OF ENGINEERS. ARCTIC CONSTRUCTION AND FROST EFFECTS LABORATORY. Development of power iccoring rig; investigation of construction and maintenance of airdromes on ice, fiscal year 1954. Boston, Mass., Mar. 1954. 45 l. (14.5 x 20 in.) incl. 36 sheets of drawings, etc., and 7 photos on 3 plates.

"Complete working drawings of the experimental rig are presented together with a summary of the basis of design, descriptions of the separate parts, discussion of operation methods and modifications suggested by tests and operating experience. The device removes cores 3 in. in diam. from snow and ice to depths of 6-25 ft. It is designed for rapid, shallow surveying of extended areas but can be used for deeper drilling. The rig is ski-mounted for easy towing and can be operated by two men."—SIPRE.

48547. U. S. ARMY. CORPS OF ENGINEERS. St. Paul District. Comprehensive report, investigation of military construction in arctic and subarctic regions, 1945–1948. Main report. Prepared for Office of the Chief of Engineers, Airfields Branch, Engineering Division, Military Construction, June 1950. xi, 68 p. incl. 44 plates (part fold.), illus., diagrs., graphs, maps, tables. 18 refs.

Contains data and results from investigations at Northway Airfield, Eleson and Ladd Air Force Bases, and the Fairbanks Research Area to determine design methods for use in arctic and subarctic military construction, with special reference to permafrost problems. Construction equipment and methods, weather-station data, research on thermal proper-

ties of soils and insulating materials, and interpretation of frozen and unfrozen ground conditions from aerial photographs are described, as well as theoretical studies, field tests of model structures, and geophysical exploration methods.

48548. U. S. ARMY. CORPS OF ENGINEERS. St. Paul District. Engineering problems and construction in permafrost regions. [Washington, D. C.] 1956. vi, 53 p. illus., diagrs., tables, text map. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, no. 3.) 9 refs.

Techniques of aerial and field reconnaissance, design, construction, and maintenance in permafrost areas are discussed. The location of permafrost in the Northern Hemisphere is mapped, and the average depths to permafrost for a few stations in Alaska and for the U. S. S. R. are tabulated. Particular emphasis is given to construction of roads, airfields, and buildings as well as the development of water supply and sewage systems.

48549. U. S. ARMY. CORPS OF ENGINEERS and CANADIAN ARMY ENGINEERS. Digest of current information on perma-frost. Reproduced by Deputy Installations, Alaskan Air Command, 1949. 3 p. l., 57 p. diagrs., map. 12 refs.

Contains a comprehensive but for the most part non-technical summary of the general and engineering aspects of perma-frost. A number of simplified illustrations are included which indicate the proper methods for placing various types of foundations in permafrost. A brief glossary of permafrost terms is added.

Copy seen: AMAU.

48550. U. S. ARMY. MOUNTAIN AND COLD WEATHER TRAINING COM-MAND. Mountaineering notebook. Fort Carson, Colo., 1956? 171 p. diagrs, Contains a series of lesson plans designed to prepare better the individual soldier for military operations in mountainous country. The environment, including snow and cold, is similar in many respects to that encountered in the Arctic, and many suggestions relative to personal hygiene and survival techniques are equally applicable for polar regions. Emphasis is placed on military aspects, but sections are also included on preparation of shelters and rations. A glossary of mountaineering terms is added.

Copy seen: AMAU.

48551. U. S. ARMY. MOUNTAIN AND COLD WEATHER TRAINING COMMAND. Winter handbook. Camp Hale, Colo., 1955? 238 p. diagrs., Process print.

The handbook designed for military personnel contains a series of 27 lessons covering various aspects of operations in winter or under similar conditions. Clothing and sanitary problems are outlined as well as types of improvised shelters, and care of equipment. Several lessons deal with land navigation in mountains and in arctic or subarctic regions. Specific military topics discussed include care of weapons, camouflage techniques, use of mines in snow and ice, and individual fighting techniques.

Contract number DA-44-177–188).

Contains reports by members of five 1953 field parties studying physical characteristics of the icecap and its marginal ice-free land in northwest Greenland. The Ramp party worked in the Nunatarssuak area, with emphasis on the ice ramp forming Nuna Takeoff, the Twin Glaciers and the adjacent ice-free land. The Norcut party made a traverse of the ice sheet to Inglefield Land and a reconnaissance of part of the north-facing ice cliff and the adjacent ice-free land. The Solo party studied the ice ramp forming Thule Takeoff and made a traverse on the ice sheet to a point on the icecap approx. 300 miles east of Thule. The Solair party made a detailed reconnaissance survey of the geology in the area south and east of Thule and of Wolstenholme and Saunders Islands. The fifth field party, Anchor, located, marked and mapped a safe route traversing the Thule Ramp. The results of this work, coordinated by Stanford Research Institute are abstracted in this Bibliography under the authors' names, viz:

48554. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND. Ft. Eustis, Va. Operation Ice Cap: D7 tractor, ladder type track, vehicle tests; report no. 120, v. 2, part B, book 2. Ft. Eustis, Va., Mar. 1, 1954. 279 l., illus., diagrs., tables. Process print. Prepared by Noville and Associates.

"The modified D7 caterpillar tractor, equipped with special ladder-type tracks, was tested in Greenland for ground pressure, drawbar pull, maximum speed, gradeability, maneuverability, and fuel consumption over powder and compacted snow under various sled-train-load conditions. The test procedures are described, and the results are tabulated and graphed.

The maximum drawbar pull over soft, virgin snow was 16,000 lb. The vehicle made 18 passes over soft snow with and without load before trail deterioration occurred; and in second gear climbed a 3° wet snow slope towing a 12-ton gross load, a 6° crusted-snow slope towing 14 tons, and a 3° ice slope with a 28-ton The turning radius was gross load. approximately 50-60 ft. when towing a gross load of 14 tons, and 425 ft. with a gross load of 42 tons. Average fuel consumption on soft snow was 0.31 gallons/ mi. for 1,000 lb. drawbar pull. A maximum speed of 6.7 m. p. h. was obtained in fourth gear. The disadvantages of the vehicle are listed and recommendations for improvement are made."-SIPRE.

Copy seen: DES.

48555. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND, Ft. Eustis, Va. Operation Ice Cap: Frandee sno-shu model "D" tests; report no. 120, v. 2, part E. Ft. Eustis, Va., Mar. 1, 1954. 100 l., illus., diagrs., tables. Process print. Prepared by Noville and Associates.

"The Frandee sno-shu, a lightweight, relatively high-speed, gasoline-powered vehicle was tested in Greenland for ground pressure, drawbar pull, maximum speed, gradeability, fuel consumption, and maneuverability over fine-grained and compact snow with various sled-train-load conditions. The vehicle design characteristics and test procedure are described. and the results are tabulated. Maximum drawbar pull was approximately 2,700 lb. in either first or second gear. The drawbar pull/weight ratio was about 0.71:1 with a gross weight of 3,800 lb. The sno-shu was the fastest vehicle in the test program, capable of sustaining speeds above 20 m. p. h. Fuel consumption depended on snow conditions and drawbar pull, varying from 1 mi./gallon with a full tow load to 2 mi./gallon without load on virgin snow, averaging 0.87 gallons/mi. per 1,000 lb. drawbar pull. The vehicle was able to negotiate a 3° slope with a tow load and a 12° slope without load, although track and side slip were evident. The track system, consisting of wooden cleats fastened to rubber belts running over pneumatic tires, permitted runs at high speeds for extended periods without damage. The forward keeled-ski steering system was effective in stabilizing the vehicle at high speeds and in preventing deflections from course, except on hard ice surfaces. Recommendations for improvements are made."—SIPRE.

Copy seen: DES.

48556. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND. Ft. Eustis, Va. Operation Ice Cap: modified D7 LGP caterpillar vehicle tests; report 120, v. 2, pt. B, book 1. Ft. Eustis, Va., Mar. 1, 1954. 135 l., illus., diagrs., graphs, tables. Process print. Prepared by Noville and Associates.

"The ground pressure, drawbar pull, maximum speed, gradeability, maneuverability, and fuel consumption of a widertracked, higher, and more powerful D7 caterpillar tractor were tested in Greenland over fine-grained and compacted snow under various sled-train-load conditions. The test procedures are described, and the results are tabulated and graphed. Maximum drawbar pull was 15,000 lb. at 0 percent slip on compacted snow. The vehicle made 15 passes on soft snow with and without load before trail deterioration occurred, and climbed 6° bare ice slopes in second gear when towing a gross load of 28 tons. The turning radius was about 30 ft. when towing a gross load of 9 tons, 60 ft. when towing a 14-ton gross load and about 400 ft. with a gross load of 37 tons. Maximum speeds under various conditions ranged from 3 to 8.4 m. p. h. The average fuel consumption on soft snow was 0.33 gallons/mi. for 100 lb. drawbar pull. Engine stability was generally good. The vehicle was difficult to enter, was too heavy, and "heeled in" because of a center of gravity too far to the rear. Other disadvantages, primarily in winterizing adequacy and operator comfort, are listed, and suggestions for improvements are made."-SIPRE. Copy seen: DES.

48557. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND. Ft. Eustis, Va. Operation Ice Cap: reconnaissance sled tests; project no. 120, v. 2, part G. Ft. Eustis, Va., Mar. 1, 1954. 54 l., illus., diagrs., tables. Process print. Prepared by Noville and Associates.

"Two types of one-ton sleds (1952 and 1953 models) for towing by light-weight reconnaissance vehicles were tested in Greenland for load-distribution effects,

ground pressure, penetration, surface effects and sliding resistance over finegrained and compacted snow. The two sleds were nearly identical in design, with full-length, symmetrical runners of flat steel plate, and differing only in size and in minor construction details such as retractable fore and aft keels. procedure is described and the results are tabulated. The 1953 type sled with a 5,700 lb. load showed maximum penetrations of 1-3 in. in virgin snow and 3-7 in. after 15 passes. The average starting resistance of the 1953 model equipped with a four-man wanigan was 2,800 lb.; the maximum sliding resistance was 650 lb. in virgin snow. The average sliding resistance of the 1952 model with a oneton load was about 500 lb. on glare ice. 720 lb. up a 3° slope and 150 lb. down the same slope. Minimum turning radius of the 1952 sled when towed by the sno-shu was 10 ft.; that of the 1953 model when towed by the sno-cat was 75 ft. Both sleds tracked and rode poorly because of their short single-runner length. towbar shock-spring rate was too slow for train operation of three or more loaded sleds. Other disadvantages are listed and recommendations for improvement are made."-SIPRE. Copy seen: DES.

48558. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND. Ft. Eustis, Va. Operation Ice Cap: rolligon vehicle tests; report no. 120, v. 2, pt. A. Ft. Eustis, Va., Dec. 12, 1953. 217 l., illus., diagrs., tables. Process print. Prepared by Noville and Associates.

"Tests were made on the inland ice and its approaches, North Greenland, to evaluate the operating capabilities and characteristics of Rolligon tractors as well as powered and unpowered trailers under various ground conditions, and to obtain design data for large cargo vehicles using the Rolligon principle. The test procedures, measurement methods, and instruments used are described, and the results are tabulated and graphed. Rolligon principle consists essentially of using low pressure air bags for flotation and traction, and a set of powered rollers above the bags for both load support and friction drive to the bags. The rollers tested were convex in shape with a short center section of uniform diameter tapering down to the ends, and had steel cores covered with a thick treated layer of rubber. The bags showed satisfactory trailpenetration and turning-radius characteristics, independent of snow-density Multiple passes and -cover conditions. did not destroy the trail nor materially change the underlying snow structure. Average penetration was 3-4 in. on dry, wind-blown snow, with gross vehicle weights from 10,000 lb. (no payload) to 15,000 lb. (full payload). Tractive ability and durability of the bags were poor. Maximum operating speed at 6,000 ft. elevation was 6 m. p. h. Vehicle bounce and sway was extremely severe and normal vehicle speed was generally restricted to 3.5 m. p. h. The greatest immediate usefulness of the Rolligon bag principle is seen in their use with unpowered trac-Suggestions for improvement are tors. made."-SIPRE. Copy seen: DES.

48559. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND. Ft. Eustis, Va. Operation Ice Cap: sled and runner ski tests; report no. 120, v. 2, part F. Ft. Eustis, Va., Feb. 19, 1954. 360 l., illus., diagrs., tables. Process print. Prepared by Noville and Associates.

"Tests were made in Greenland on load distribution, ground pressure, penetration, surface effects, and sliding resistance of standard Otaco 10-ton sleds equipped with various types of skis (12, 8, 24 and 30 in. wide; flat bottom, 10°- and 20°angle vee bottom; rounded and pointed nose) to determine the best combination of loads and runner skis for operation over soft and compact snow. The experimental runners were made of steel plate and bolted to the original narrow runners. Test procedures are described and performance data are tabulated and graphed. The 10° vee was the most satisfactory of the three ski-bottom types tested. Angle of attack and nose type had little or no effect on towing resistance due to the fact that the tip and a larger portion of the riser rode out of the snow. The nose of the ski hastened trail deterioration considerably, resulting in hummock formation during multiple Ground clearance was adequate only with sleds equipped with 6 in. and 10 in. chairs. Other design deficiencies are listed, and recommendations for improvement are made."-SIPRE.

Copy seen: DES.

48560. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION

RESEARCH AND DEVELOPMENT COMMAND. Ft. Eustis, Va. Operation Ice Cap: Tucker sno-cat model 743 vehicle tests; report no. 120, v. 2, part D. Ft. Eustis, Va., Mar. 1, 1954. 109 1., illus., diagr., tables. Process print. Prepared by Noville and Associates.

"The Tucker sno-cat, model 743 double drive, was tested in Greenland for ground pressure, drawbar pull, maximum speed, gradeability, fuel consumption, maneuverability, and ability to handle various types and sizes of towed loads on fine-grained and compacted snow. test procedures are described, and the results are tabulated. The sno-cat exerted a maximum drawbar pull of 6,000 lb. with a vehicle gross weight of 6,800 lb. (a drawbar-pull-to-weight ratio of about 0.88), performing better in this respect than any other vehicle tested during Operation Ice Cap. Vehicle flotation was satisfactory and penetration of the snow cover was slight, amounting to 7 in. after 30 passes over the same trail. Snocat maneuverability over all types of snow and ice terrain with towed loads up to maximum capacity was better than with any other tracked vehicle tested in the program. The vehicle was capable of negotiating 6° slopes on hard ice with a gross weight of 10,000 lb. at speeds from 8-10 m. p. h. in third gear. Maximum practical towed load was approximately 10,000 lb. gross weight, requiring drawbar pulls from 2,000-4,000 lb., depending on surface and grade. Fuel consumption was about 0.54 gallons/mi. for 1,000 lb. drawbar pull. The main disadvantage of the vehicle was the accumulation of snow around sprockets and inside pontoons, which froze solid on parking. Other disadvantages are listed and recommended improvements are outlined."-SIPRE. Copy seen: DES.

48561. U. S. ARMY. TRANSPORTATION CORPS. TRANSPORTATION RESEARCH AND DEVELOPMENT COMMAND. Fort Eustis, Va. Summary, final report, Operation Ice Cap 1953, scientific program (Program B), SRI Project 826, Gneiss. Fort Eustis, Va., Apr. 30, 1954. iii, 19 p. map. (Dept. of the Army Project no. 9–98–07–002, Contract no. DA-44–177–188.) Prepared by Howard B. Hutchinson, Stanford Research Institute.

The background, objectives, and organization of Program B are described: the results of scientific investigations

designed to solve problems of military trafficability are discussed, evaluated, and summarized; and recommendations for future research are made. Both theoretical and applied studies were made in Nunatarssuak, on the Thule ramp, the icecap itself, and in Inglefield Land, to determine how physical characteristics affect surface transportation from the ice-free zone across the transition zone at the edge of the icecap to the dry snow core. Some of the major surface types of snow were located and identified; the geology and geomorphology of the icefree zone were investigated and mapped to determine the effects of the bedrock on the movement and structure of the ice and ice thickness; and access routes from the coastal margins to the ice and safe routes were established. A glossary of glaciological terms is appended.

Copy seen: AMAU.

48562. U. S. ARMY. TRANSPORTA-TION CORPS. TRANSPORTATION TRAINING COMMAND. Transportation Arctic Group. 1955 report; v. 1, Greenland. Fort Eustis, Va., Jan. 30, 1956. xi, 365 p. illus., charts, diagrs., maps, tables.

The results of investigations in the Thule area to determine requirements and develop facilities for moving personnel and cargo over snow and ice are reported, and recommendations for the solution of the problems encountered are made. The research program included studies of optimum ground transportation equipment (T43E2 Snow Tractor, XM357 Rolligon, D8 LGP Tractor, and 10-ton plastic sled); the development of techniques for heavy and light swing operations during short and long hauls; the development of navigation, trail reconnaissance, and trail marking techniques on the icecap; investigations on transportation capability at very low temperatures and in darkness; and the development of cargo transfer methods in marginal areas and on the icecap. Observations were also made of weather, terrain, and daylight and darkness conditions. Effects of arctic environment on the capability of movement on the icecap were studied. Semi-permanent quarters and facilities were built at the edge of the icecap at Camp TUTO. Data on logistics, results achieved, meteorological elements (fog, snow, wind, temperatures, light and darkness, visibility, whiteout, etc.) and terrain conditions (including crevasses) are tabulated and graphed. Health conditions and effects of the environment on personnel are reported. The Transportation Army Group was formed in 1953 to implement a five-year arctic program approved by the U.S. Army. This report covers operations during the third year of the plan which were of considerably greater magnitude than in the previous years. The earlier program was continued but, in addition, year-round operations over long distances and cost-per-mile data for both short and long hauls were studied. The results proved the feasibility of transporting personnel and heavy loads over the icecap.

48563. U. S. ARMY AIR CORPS. Report of cold weather detachment, winter of 1942-1943. Fairbanks, Alaska, Ladd Field, 1943. 2 v. 552, 494 p. charts, illus., map, tables.

A comprehensive report is presented of the program and test results. The winter's program was the first following the Detachment's reactivation at Ladd Field, Fairbanks, Alaska, after suspension due to Japanese activity in the nearby Pacific area. Results were particularly valuable because of the unusual severity of the winter. Emphasis of the program was placed on testing aircraft, component parts, and auxiliary equipment. Vol. 1 in four parts comprises general, test aircraft, miscellaneous, and commercial representatives' reports. Vol. 2 contains reports from the following laboratories: aero medic, clothing, armament, materials, propeller, aircraft, equipment, power plant, and photographic. The following equipment was among that tested: airplane wheels, tires, and brakes; hydraulic systems in aircraft, control systems; heaters and defrosters; de-icing equipment; airplane skis; airplane engines and housing; ignition, fuel and oil systems; propellers and governors; coolant systems; armament and bombardment equipment; radio equipment and other instruments; ground heaters and power plants; and servicing equipment. The results in general showed the equipment to be unsatisfactory for use in the Arctic. Copy seen: AMAU.

48564. U. S. ARMY AIR FORCES. AIR SERVICE COMMAND. List of Russian material on cold weather operation. Preliminary. Fairfield, Ohio, Patterson Field, June 1943. 9 p. (Its: Special studies, no. 1.)

Approximately 140 references to books, journal and newspaper articles are listed under such headings as, alighting gear and landing fields, engine starting, flying clothing, ice reconnaissance, icing etc., (nearly half) under arctic aviation: non-technical.

Copy seen: AMAU.

48565. U. S. ARMY AIR FORCES. WEATHER INFORMATION BRANCH. Climate of Okhotsk, U. S. S. R. Washington, D. C., Jan. 1944. 4 1. diagrs., maps, table. (Its: General Climatic Information Guide, no. 81.)

General climatic conditions are presented for the area on the north shore of the Sea of Okhotsk. Data based on 2-32 years of record are given for air masses, temperature, precipitation, cloudiness, visibility, and wind. Topographic and soil trafficability maps are given. Military implications of climatic conditions are tabulated. Graphed data include number of days with snow cover and the wind frequency distribution. The climate of Fairbanks, Alaska, is somewhat comparable to this area.

Copy seen: AMAU.

48566. U. S. ARMY AIR FORCES. WEATHER INFORMATION BRANCH. Climate of Petropavlovsk, Kamchatka, U. S. S. R. Washington, D. C., Dec. 1943. 4 l., diagrs. maps, table. (*Its*: General climatic information guide, no. 78.)

General climatic conditions are discussed for the southeast coastal area of Kamchatka. Air masses, temperature, precipitation, cloudiness, visibility, and winds are included. Topographic and soil trafficability maps are given. Military implications of climatic conditions are tabulated. Climatic data graphed include number of days with snow cover, and the wind frequency distribution. The temperature and precipitation regime at Dillingham, Alaska (59°03' N. 158°27' W.) is comparable to that of Petropavlovsk.

48567. U. S. BUREAU OF AERO-NAUTICS (NAVY DEPT.). Height change charts 500 millibar. Washington, D. C., Jan. 1949-May 1952. 41 nos. maps. (Its: Project Arowa, TED-UNL-MA-501.)

The daily 24-hr. changes in the height

of the 500-mb. surface for Jan. 1949-May 1952 in the Northern Hemisphere are represented on a series of polar stereographic projections. Isopleths for 200-ft. height changes are drawn, and the estimated maximum change is indicated in each center.

48568. U. S. BUREAU OF AERO-NAUTICS (NAVY DEPT.). Height change track charts 500 millibar. Washington, D. C., 1949–1952. 4 nos. maps. (*Its*: Project Arowa, TED-UNL-MA-501.)

Five-day track charts of the centers of maximum rise and fall of the 500 mb. surface in the Northern Hemisphere for 1949, 1950, 1951, 1952 are given. The centers plotted on a polar stereographic projection include the maximum 24-hr. tendency and the day of occurrence. Considerable data are included for the area north of 60° lat.

48569. U. S. BUREAU OF RECLAMA-TION. Laboratory tests on proposed embankment materials: Caribou Creek Dam, Caribou Creek Project, Alaska. Denver, Colo., Mar. 1956. 11 p., graphs, tables. (*Its*: Earth Laboratory report, no. EM-448).

Contains results of gradation, Proctor density, and Atterberg limits tests on soil samples for use in the embankment of this dam. The Project consists of a dam, tunnel, penstocks, and powerhouse to supply power for the Palmer-Anchorage area. The dam is about 60 miles east of Palmer (61°36' N. 149°07' W.) where permafrost is generally within three ft. of the surface. Samples tested, primarily sandy gravel, containing 17 to 46 percent fines of low plasticity, test procedures, etc. are briefly described; appended are description of and results presented in full. 48574. U. S. COAST AND GEODETIC SURVEY. Magnetograms and hourly values College, Alaska, 1951. Washington, D. C., 1955. 191 p. diagrs., tables. (Its: MHV-Co51) 5 refs.

Records are presented of the College Magnetic Observatory located at 64° 51'.6 N. and 147°50'.2 W. Two magnetographs, the Eschenhagen and the insensitive, were maintained in operation during the period (Merril L. Cleven, observer-in-charge). Basic hourly values and derived means are tabulated for each of the magnetic elements: declination, horizontal intensity, and vertical intensity. Approx. quarter-size reproductions of the Eschenhagen magnetograms are shown. Selected insensitive magnetograms are reproduced to about 35 percent of original size.

tables. (Its: Serial, no. 792.)

Annual publication containing daily tide predictions, with list of reference stations, including Narvik, Norway, and Kem and Yekaterininskaya, U. S. S. R.; tidal differences and ranges, including Greenland Sea, Barents Sea, Beloye More, Karskoye More, Zemlya Frantsa Iosifa waters, Svalbard waters. Data are given as in previous issues listed as No. 42977.

Copy seen: DN-HO.

48580. U. S. COAST AND GEODETIC SURVEY. Tide tables west coast North and South America, including the Hawaiian Islands, 1957. Washington, D. C., U. S. Govt. Print. Off., 1956. 226 p. graphs, tables. (Its: Serial, no. 791.)

Annual publication containing daily tide predictions, with list of reference stations, including, for Alaska: Anchorage, Cordova, Dutch Harbor, Juneau, Ketchikan, Kodiak, Massacre Bay, Nushagak Bay, Seldovia, Sitka, St. Michael, and Sweeper Cove. Tidal differences and ranges include Southeast Alaska waters, Gulf of Alaska, Aleutian waters, Bering Sea and Strait, Chukchi and Beaufort Seas. Data are given as in previous issues listed as No. 42978.

Copy seen: DN-HO.

48581. U. S. COAST AND GEODETIC SURVEY. United States coast pilot 9, Alaska, Cape Spencer to Arctic Ocean. Sixth (1954) edition. Washington, D. C., U. S. Govt. Print. Off., 1955. 673 p. illus., text charts, tables. (Its: Serial, no. 779.) Supplement, with additions and corrections to May 19, 1956. 17 p.

Revised edition of No. 18303 of Arctic Bibliography (formerly Alaska, pt. 2, Yakutat Bay to Arctic Ocean), corrected through Notice to mariners 45 of Nov. 6. 1954. General and regional navigation information and sailing directions through chap. 7 (Aleutian Islands) are similar in scope to the previous edition. Chap. 8 deals with Bering Sea and Strait and northward to Point Hope (68°20' N. 166°45' W.) in the Chukchi Sea, but not, as the previous edition, eastward to Herschel Island, Mackenzie District.

Appendices include tables of monthly mean sea temperatures and densities for ten localities; distance table for 33 localities; guide to U.S. federal offices in Alaska; radio stations broadcasting weather information; climatological tables for 30 land and 37 ocean areas; dates of ice breakup and freezeup for 41 localities on Gulf of Alaska, Bering Sea and Strait, Chukchi Sea; glossary of approx. 250 ice (and associated) terms, and guide to description of ice conditions for the ice observer. Extensive index to coastal features (p. 647-73) is included.

Copy seen: DN-HO.

48582. U. S. COAST GUARD. International ice observation and ice patrol service in the North Atlantic Ocean, season of 1955. Washington, D. C., U. S. Govt. Print. Off., 1956. 114 p. charts (12 fold.), graphs, tables. (Its:

Bulletin, no. 41.)

Contains section by A. J. Bush (p. 1-57) reporting on the 1955 season (Feb. 27-July 15). Sixty ice observation flights (no surface patrol necessary for fifth consecutive season) and four cruises by the oceanographic vessel Evergreen were Radio broadcasts of twice-daily ice bulletins to mariners began Mar. 7. Communications and monthly ice conditions are discussed. Charts showing ice conditions and surface isotherms, Mar. through June, and detailed chronological tables of ice reports are given. Only 61 bergs drifted south of 48° N., compared with the 1900–1955 average of 396 bergs. Their distribution was abnormal, none being found along the east slope of the Grand Banks or in the Flemish Cape area.

The second section, Physical ocean-ography of the Grand Banks and the Labrador Sea in 1955, by F. M. Soule and J. E. Murray (p. 59-114), deals with oceanographic investigations from the Evergreen, Mar. 30-July 25, during which 296 stations were occupied, 23 of them forming a section across the Labrador Sea. New equipment for taking 40gallon water samples from subsurface levels down to 150 m. is described. In addition to usual temperature and salinity measurements, 264 samples were taken across the Labrador Sea section for determination of total phosphorous con-Discussion includes: dycentration. namic topography of Grand Banks and southern Labrador Sea; position and strength of the Labrador Current: temperature-salinity relationships of Labrador Current water and Atlantic Current water and comparison with previous years; relation between position of the cold wall and strength of adjacent currents; distribution of velocity and temperature in vertical sections across the Labrador Current: dynamic topography of sea surface near the section from South Wolf Island, Labrador, to Cape Farewell. Greenland: phosphorous concentration across this section. Both Labrador and Greenland ends of the section showed a decrease from the abnormally tive circulation in the Labrador Sea characterizing the last several years. Tables of oceanographic data (depth. temperature, salinity) collected at each station are given (p. 81-114). section is also published as: Woods Hole. Mass. Oceanographic Institution. Contribution, no. 801.

48583. U. S. CONGRESS. HOUSE.

Committee on Interior and Insular Affairs.

Alaska, 1955. Hearings before the Subcommittee on Territorial and Insular

Affairs... pursuant to H. Res. 30.

Washington, D. C., U. S. Govt. Print.

Off., 1956. 5 pt.: 310, 344, 217, 360, 287 p.

fold. map, graphs, tables. (U. S. 84th

Congress, 1st sess. House. Serial no. 27.)

Contains statements of Alaskan viewpoints on statehood as presented to the Subcommittee by Territorial, municipal and federal officials, business and professional men, representatives of clubs, airlines, labor unions, etc. Hearings were held Sept. 14-Oct. 6, 1955 in the principal cities and towns through the Territory. viz: Fairbanks, Barrow, Nome, McKinley Park, Anchorage, Elmendorf Air Base, Cordova, Palmer, Seward, King Salmon, Kodiak, Juneau, Sitka, Petersburg, Ketchikan, Hydaburg, Klawock, Craig, and Annette Island Reserve. Most aspects of Alaskan life and conditions are discussed as related to the question of statehood: business and industry (especially fisheries), trade and commerce, labor problems, taxes, public works, laws. natural resources and their development, growth of cities, cost of living, education, public health, native rights and restriction, natural parks, tourism, agriculture, protection of wildlife, etc.

48584. U. S. CONGRESS. HOUSE. Committee on Interstate and Foreign Commerce. Air carrier certificates, Alaska and Hawaii. Hearings before a subcommittee of the Committee on Interstate and Foreign Commerce, House of Representatives, Eighty-fourth Congress, second session, on H. R. 9252, a bill to amend section 401 (e) of the Civil Aeronautics Act of 1938 in order to authorize permanent certification for certain air carriers operating in Hawaii and Alaska; and H. R. 9253, a bill to amend section 401 (e) of the Civil Aeronautics Act of 1938 in order to authorize permanent certification for certain air carriers operating between the United States and Alaska. March 28 and 29, 1956. Washington, D. C. U. S. Govt. Print. Off., 1956. iv, 154 p. illus., maps (part fold.)

Contains the text of hearings on two bills introduced by the Hon. E. L. Bartlett, Delegate-in-Congress from the Territory of Alaska. They are to enable Alaskan airlines to obtain permanent instead of temporary operating certificates. Statements are made by Governor Heintzleman and other government officials, by executives of the Alaska Coastal, Trans-Pacific, Alaska, Northwest, Ellis, Northern Consolidated, Wien Alaska, Cordova, and Pacific Northern Airlines, also Reeves Aleutian Airways, as well as by labor organizations and other interested parties. They offer general information and statistical data on economic conditions and the transportation industry, as well as on development of specific airlines in Alaska. Route maps as of Sept. 30, 1955 for individual carriers are given. Copy seen: DLC.

48585. U. S. CONGRESS. SENATE. Committee on Interior and Insular Affairs. Alaska mental health. Report to accompany H. R. 6376. Washington, 1956. 34 p. (84th Cong. 2d sess. Senate. Report no. 2053.)

Report on the House of Representatives' bill to provide hospitalization and care for the mentally ill, with the Senate Committee's amendments to it. The grants-in-aid provision, and land grant are discussed and a sectional analysis is

grants-in-aid provision, and land grant are discussed and a sectional analysis is given of the amended Bill, with copies of correspondence, etc. Copy seen: DLC.

48586. U. S. CONGRESS. SENATE. Committee on Interstate and Foreign Commerce. Alaska and west coast transportation problems. Hearings before the Committee on Interstate and Foreign Commerce, United States Senate, Eighty-fourth Congress, second session, pursuant to S. Res. 13 and S. Res. 163, resolutions to investigate certain problems relating to interstate and foreign commerce. . . . Washington, D. C., U. S. Govt. Print. Off., 1956. vii, 407 p. illus.

Includes hearings held Oct. 10 and 11, 1955 at Anchorage and Oct. 14 and 15 in Juneau. Statements are given of Alaskan Territorial and city officials, the Alaskan delegate to Congress, repr-sentatives of business and industry, merchant marine, land transport, shipping and airlines, etc. Subjects dealt with include rate regulations, air transport to, from, and within Alaska, rail transport, trucking, passenger and freight steamer service to Alaska, harbor construction, freight handling. Also contains some discussion and resolutions on Alaskan statehood.

Copy seen: DLC.

48587. U. S. CONGRESS. SENATE. Committee on Interstate and Foreign Commerce. Pacific Coast and Alaska fisheries. Hearings before the Committee on Interstate and Foreign Commerce, United States Senate, Eighty-fourth Congress, second session, pursuant to S. Res. 13, a resolution to investigate certain problems relating to interstate and foreign commerce. . . Washington, D. C., U. S. Govt. Print. Off., 1956. viii, 651 p. illus., map.

Contains material taken from the full transcript of hearings held Oct. 10-Dec. 5, 1955, in various cities, concerning fisheries and related problems of the

Pacific Coast and Alaska. Subjects covered by the statements, letters, documents, etc., include fish landings, fluctuations and depredation; fishing methods, their control and other means of conservation; competition of foreign fisheries, problems of the canning industry; research; labor and wages; special problems of the salmon fishery; problems of industrial efficiency, etc. Copy seen: DI.

48588. U. S. CONGRESS. SENATE. Committee on Interstate and Foreign Commerce. Pacific Coast and Alaska fisheries. Report pursuant to S. Res. 13 and S. Res. 163, 84th Congress, providing for the investigation of certain problems within the jurisdiction of the Committee on Interstate and Foreign Commerce. Washington, D. C., U. S. Govt. Print. Off., 1956. iii, 40 p. tables. (84th Cong., 2d sess. Senate. Report no. 3801.)

The investigation concerned itself with the problem of establishing a stable policy of management and development in the Alaskan and West Coast fisheries, of protecting it from "ruinous competition of low cost fish and fish products" from abroad, and of marketing. In conclusion, the fisheries problems are summarized, recommendations are made for a new federal fisheries authority at policy-making level; for conservation and development program; regulation of imports; and for economic aid to the industry.

Copy seen: DLC.

48589. U. S. CONGRESS. SENATE. Committee on Interstate and Foreign Commerce. Permanent certification for Alaska-Hawaii airlines. Hearing before the Committee on Interstate and Foreign Commerce, United States Senate, Eightyfourth Congress, second session, on S. 3163, a bill to amend section 401 (e) of the Civil aeronautics act of 1938 in order to authorize permanent certification for certain air carriers operating in Hawaii and Alaska, and S. 3164, a bill to amend section 401 (e) of the Civil Aeronautics Act of 1938 in order to authorize permanent certification for certain air carriers operating between the United States and Alaska. March 26, 1956. Washington, D. C., U. S. Govt. Print. Off., 1956. iv, 107 p. diagrs., tables.

Contains statements by officials of the Territory of Alaska and of nearly all air carriers operating in Alaska, including the Hon. E. L. Bartlett, Governor B Frank Heintzleman, O. F. Benecke of Alaska Coastal Airlines, Ralph Brown of Alaska Research Associates, Nelson David of Alaska Airlines, Raymond I. Petersen of Northern Consolidated Airlines, Inc., Merle K. Smith of Cordova Airlines, Inc., and Arthur G. Woodley of Pacific Northern Airlines, Inc. Text of an article by Harry Lever dealing with Wien Alaska Airlines is reprinted (from Pegasus, Jan. 1956). Summaries of mail ton-miles, service mail pay, and subsidy estimates are tabulated for various carriers. Nearly all presentments favored permanent certification.

Copy seen: DLC.

48590. U. S. CONGRESS. SENATE. Committee on Interstate and Foreign Commerce. Program for the rehabilitation of the Alaska salmon fisheries. Report by Warren G. Magnuson, chairman. Washington, D. C., U. S. Govt. Print. Off., 1956. iii, 14 p. illus. Committee print., 84th Cong., 2d sess., Senate.

Based on experts' study, following drop of catches in the past five years, the program recommends predator control, stream improvement, lake fertilization; direct feeding of wild salmon fry is stressed. Estimates of cost are given, also biological and fishing data.

Copy seen: DI.

48591. U. S. DEPT. OF STATE. Proposal to exchange flights over Arctic with U. S. S. R. (*Its*: Dept. of State bulletin, Oct. 1, 1956. v. 35, no. 901, p. 508–509.)

The U. S. Government informed the Soviet Government on Sept. 19, 1956, that it was prepared to arrange reciprocal aerial observations of arctic ice in connection with the International Geophysical Year. Nome, Alaska was suggested as the U. S. terminal and Murmansk the Soviet terminal. The complete text of the U. S. note is given.

Copy seen: DLC.

48592. U. S. DEPT. OF THE AIR FORCE. Survival; training edition. Washington, D. C., Feb. 1956. 2 p. l., 373 p., illus, diagrs., maps, tables. (Its: AF Manual 64–3.)

Deals with the general problems of survival on land including first aid and food supply (p. 1–140). Problems peculiar to arctic (p. 141–86), desert, and tropic environments are presented in turn. Arctic environment, first aid (frostbite, immersion foot, snow blinding, carbon monoxide poisoning), signalling and preparation of shelters are explained. Food

supply is treated in detail with illus. of plants and game. Brief sections are also included on mountain travel and crevasse rescue, survival on sea ice and at sea. Graphic presentation of information and a useful index are features of the manual.

Copy seen: DLC.

48593. U. S. DEPT. OF THE ARMY. Land navigation by dead reckoning. Washington, D. C., Sept. 1949. 32 p. illus., diagrs. table. (*Its*: Technical Bulletin, TB Eng 90.) Prepared by Andrew Taylor.

Contains fundamentals of dead reckoning navigation for the orientation of ground personnel, especially in desert and arctic areas. Distance measurements, direction-finding instruments, navigation, and automatic plotting instruments are briefly described. A glossary of terms is appended.

Copy seen: DLC.

48594. U. S. DEPT. OF THE INTE-RIOR. ALASKA RAILROAD. Prospectus of rehabilitation program, with miscellany. Anchorage, Alaska, Aug. 19, 1946. 12 l. Mimeographed.

Major operating problems which contributed to a deficit for the railroad of 2.5 million dollars in 1946 are discussed, and a planned program of rehabilitation is outlined. Major problems include expensive maintenance, insufficient warehouse facilities, antiquated equipment, competition from other carriers, and inadequate labor supply. The cost of the program is estimated at nearly 32 million dollars.

48595. U. S. DEPTS. OF THE ARMY AND AIR FORCE. Arctic construction. Washington, D. C., U. S. Govt. Print. Off., June 1952. iv, 464 p. illus., diagrs., tables, text maps. (Dept. of the Army Technical manual TM 5-560; Dept. of the Air Force Technical order TO 00-60B-2) Supercedes TB5-255-3, 25 Aug. 1950. Cf. No. 18412 of Arctic Bibliography, which is TB5-255-3, 1945.

Manual designed to acquaint military personnel with construction requirements and related engineering problems peculiar to arctic and subarctic areas. A general introduction to arctic geography is followed by a detailed presentation covering nearly all phases of construction and maintenance with emphasis on roads and air-fields. Working conditions, seasonal transportation problems, local resources, and permafrost are treated in turn. Summer work, buildings and utilities,

bridges, concreting, etc., are dealt with. Unusual applications are described, such as the use of ice and snow as construction materials, and cold-weather effects on explosives, camouflage.

48596. U. S. ENGINEER SCHOOL. LIBRARY. Alaskan railroads, a selected list. Ft. Belvoir, Va., Dec. 1947. 2 p. l., 8 l. Photostat. (*Its*: Document 8000.)

Contains approximately 130 references to periodical articles, books, and government publications, listed alphabetically by author-title. Copy seen: AMAU.

48597. U. S. FISH AND WILDLIFE SERVICE. United States landings of ground-fish from the convention area, 1893–1950. Prepared by North Atlantic Fishery Investigations, Fish and Wildlife Service, for the second annual meeting of the International Commission for the Northwest Atlantic Fisheries, held in St. Andrews, New Brunswick, June 30 to July 10, 1952. [Washington, D. C., 1952?] 7 p. 15 fold. tables. Prepared for the meeting reported in No. 35387.

Contains information on sources and procedures of compilation; species covered (with Latin names) and conversion factors. This is followed by tables for 15 species of ground-fish landed from 1893 or later, till 1950. Copy seen: DLC.

48598. U. S. FISH AND WILDLIFE SERVICE. Alaska Fisheries Branch. Alaska fisheries 1955. Washington, D. C., 1956. 5 p. illus. tables.

Contains statistics of the 1955 catch of commercial fishery products. Includes breakdown by species and areas of catch; persons and craft engaged; weight and value of landings; fish products, their weight and value; and summaries of catches since 1936. Copy seen: DI.

48599. U. S. FOREST SERVICE.

Alaska Forest Research Center. Alaska forest research: problems and present status; annual report 1955. Juneau, 1956. 42 p. 7 illus., 2 text maps, 5 graphs, 9 tables. Mimeographed. (Its: Station paper, no. 4.) 14 refs.

Second annual report of agency established in 1948, deals with work involved in managing forest resources, forest inventory initiated in 1954, and plans for 1956. Research on insects, forest management, are reported, also study of effect of logging on salmon streams.

Four streams were selected in 1949 for long-term study; two to be logged, two as controls. Precipitation, soils, run-off, pattern of streamflow and effect on fish, are briefly reported, also storm analyses, ground-water depletion, stream temperatures, channel changes, intertidal zone change, sedimentation. 1955 publications of the Center are listed.

48600. U. S. GENERAL STAFF. MILITARY INTELLIGENCE DIVISION. Siberia and Eastern Russia. Washington, D. C., U. S. Govt. Print. Off., 1918. 3 v.: 103, xl p.; 180, xxxviii p.; 121, xl p.; illus., diagrs., tables, maps. (War Department document no. 863.)

Part 1, entitled General description and introductory information, deals with the main geographical features of the area, and with transportation methods and equipment. Considerable data are given on the Trans-Siberian Railway; other railroads are discussed and mapped. Extermination of insects and local supplies and equipment are briefly noted.

Pt. 2, entitled Pacific Coast to Irkutsk, route notes and information, contains description of the routes and other railways (with list of stations on the Trans-Siberian), terrain, population, communications, climate, water supply, housing, industry, and detailed descriptions of stops along each route.

Pt. 3, entitled Central Siberia, contains description of the railway routes (stations listed), terrain, strategic points, stops along the routes, etc. Transportation on the Irtysh River, minor river routes, wagon road Irkutsk to Omsk, Lena route, and other wagon roads are described.

48601. U. S. GEOLOGICAL SURVEY. Progress of Aleutian investigations, 1946–1951, and plans for 1952–1956. [Washington, D. C.] Feb. 1952. 21, 11 p. 4 maps (2 fold.), 4 diagrs., graphs, 4 tables. Mimeographed. 40 refs.

The Aleutian volcano investigations, initiated 1946 (cf. No. 31654) comprise three interdependent phases: geologic mapping, terrain and related military engineering studies, geophysical and geochemical investigations. Activities and plans in each are reported. Geologic field mapping and military geology studies were nearly half completed by 1951. Budget for 1952–1956 is tabulated. Appendices: list of 40 principal reports, published and in preparation, from the

program; report on geophysical studies in the Adak-Great Sitkin area, by J. H. Swartz and A. E. Jones, describing instrumentation, seismic observations, tiltmeter observations, and relationship of earthquake frequency to volcanic activity; recommendations for further observations. *Copy seen:* DGS.

48604. U. S. HYDROGRAPHIC OF-FICE. Distribution of ice, Amundsen Gulf to Shepherd Bay. Washington, D. C., May 1955. 49 p. 37 text charts, graph, 2 tables. (Its: Technical report, TR-25.)

Ice distribution in the southwestern Canadian Arctic Islands (approx. 67°-72° N. 95°-126° W.) is briefly described, on the basis of expedition reports, limited aerial ice observations, climatological and oceanographic data. Charts of mean ice conditions are presented for the Dec .-Mar. period, monthly Apr.-July, fortnightly during Aug.-Sept., and monthly for Oct. and Nov.; three sectors are shown: Amundsen Gulf through Dolphin and Union Strait, Coronation Gulf and Dease Strait, Queen Maud Gulf to Shepherd Bay. Charts of observed conditions on a flight over the entire area, July 23, 1953, are also presented.

48605. U. S. HYDROGRAPHIC OF-FICE. High latitude celestial navigation tables, latitudes 70°-89°, Washington, D. C., July 1946. vi, 337 p. (*Its:* H. O. no. 230, prelim. ed.)

The volume consists of two main tables: star tables prepared for use in the north polar regions; and declination tables which can be used for either north or south polar regions. Functions tabulated in the star tables include altitude, true azimuth, and a correction term. Ten stars are listed for every hour angle and are arranged in cyclic order of azimuth. The declination tables contain altitude, azimuth angle, and a correction term.

48606. U. S. HYDROGRAPHIC OF-FICE. Ice charts of the Canadian Arctic, derived from U. S. Naval summer operations. [Washington, D. C.] 1949. 17 l. incl. 16 charts. (Its: H. O. misc. 15074.)

Ice conditions as observed from aircraft during Aug. 1949 are charted separately for 16 days and 20 flights. The observations are concentrated around Barrow Strait although two flights are recorded for one day which extended from Barrow Strait to Grant Land (northern Ellesmere) and from the Strait to Prince Patrick Island. Some observations from U. S. icebreakers are also included. Ice conditions are given graphically in terms of five classes of ice penetrability.

48609. U. S. HYDROGRAPHIC OF-FICE. Loran tables, v. 1; North Atlantic chain. 3d ed. [Washington, D. C.] 1949. xix, 352 p. maps, tables. (*Its:* H. O. pub. no. 221.)

Tables are given for standard Loran operations in the two megacycle range, utilizing stations along the eastern coast of the United States and Canada. Separate tables are given for each station pair, which include chartlets showing station positions, area covered, and distribution of loran lines, sky wave corrections, and tabulated co-ordinates. A description and examples of the use of loran tables are included. The area covered in the western North Atlantic extends from below 30° to above 60° N. lat. Copy seen: DN-HO.

48610. U. S. HYDROGRAPHIC OF-FICE. Oceanographic observations aretic waters, U. S. S. Edisto and U. S. S. Atka: cruises summer 1950, winter 1951, summer 1951, winter 1952, summer 1952. Washington, D. C., 1954. 315 p. text charts, tables. (Its: H. O. pub. no. 618-A.)

Contains oceanographic data collected on five cruises. Seventy-four stations were occupied in eastern Canadian Arctic Islands waters, Smith Sound-Robeson Channel, Baffin Bay, Davis Strait and Labrador Sea during summers 1950-1952. Water temperatures ranged from 7° C. to 1.7° C. and salinity from 30.00°/00 to 35.02°/oo (increasing with depth). Maximum transparency was 19 m. and minimum 1.8 m. During winters 1951 and 1952, 101 stations were occupied in Denmark Strait and Greenland Sea. Water temperatures ranged from 7.4° C. to -1.2° C. and salinity from 33.62°/oo to 35.40°/oo. Water was unusually clear, with transparency as high as 46 m. Data presented for each station include date and time, geographic position, bottom depth, weather and sea conditions, depth of sample, sea temperature, salinity, density, dissolved oxygen. Civilian personnel on each cruise are listed.

· , c ; . t. ), ic 3. al

d y of

Contains oceanographic data collected on two cruises in Baffin Bay, Davis Strait and Labrador Sea. In winter (41 stations occupied), surface water temperatures ranged from -1.8° C. to 3.5° C. and subsurface -0.5° C. to 4.7° C.; surface salinity from 33.04°/oc to 34.92°/oc. subsurface 33.26°/oo to 35.02°/oo. All stations were taken in freezing air temperatures. In summer (27 stations occupied in Baffin Bay-northern Davis Strait), surface water temperatures ranged from -1.9° C. to 5.6° C., subsurface -1.3° C. to 1.8° C.; surface salinity from 26.93°/oo to 34.31°/oo, subsurface 31.00°/oo to 34.60°/oo. Transparency of water ranged from 20 m. to 8 m. Data are presented for each station as in No. 48610.

48617. U. S. HYDROGRAPHIC OF-FICE. Sea ice forecasting program in support of military operations. (U. S. Office of Naval Research. Research reviews, May 1956. p. 1-9, illus., maps.)

Contains a review of the program of the United States Navy Hydrographic Office for ice observation and forecasting in the This represents the first iceforecasting service in the Western Hemisphere. System of aerial reconnaissance and ice observers is described. 180-day predictions, 30-day and 48-hour forecasts are provided. Work of Defant and Zubov was extended to devise a system of "Ice potential forecasting." program is designed to aid various military and other specialized operations which rely heavily on sea transport. Tonnage transported to arctic bases by ship during 1955 amounted to more than 3.5 million barrels of fuel oil and 0.5 million tons of other cargo.

48618. U. S. LIBRARY OF CONGRESS. Technical Information Division. Bibliography on snow, ice and permafrost, with abstracts. Washington, D. C., 1956. 2 v: 273, 190 p. (SIPRE report 12, v. 9-10, Jan.-July 1956.)

Vol. 9 contains 1500 abstracts, v. 10, 1000 abstracts, of papers on snow, ice, perennially and seasonally frozen ground and related engineering problems. Scope is similar to vols. 1–8 (listed as No. 26960, 32623, 37938, 43027, in Arctic Bibliography) with emphasis on earlier (19th century) materials and patents.

\*\*Copy seen: DLC.\*\*

48619. U. S. LIBRARY OF CONGRESS. Technical Information Division. The polar bibliography. Produced for the Dept. of Defense. [Washington.] 1956. In progress. xii, 223 p. (U. S. Air Force manual 200–132; DA Pamphlet 70–1;

OPNAV instruction 3470.3; NAVMC 1127.)

Records unpublished documents: reports, staff studies and memoranda, translations, also pamphlets, manuals and books, all prepared by the U.S. military or their contractors, issued since 1939, and free of security classification. They deal with polar and sub-polar regions, also experiments, tests and performance of equipment, operational information and cold weather techniques. man in cold environment, etc. In v 1, a thousand items are listed with abstracts of their contents; subject and author indexes are provided. A companion series, Classified polar bibliography, is projected to cover documents subject to security classification.

Copy seen: DLC.

48620. U. S. MARITIME ADMINISTRATION and U. S. BUREAU OF SHIPS. Specifications for construction of twin screw Navy small cargo ships (ice strengthened) T-AK270 class; includes modifications no. 1, dated 7 July 1955. Maritime Administration diesel electric design C 1-ME2-13a. Washingtion, D. C., U. S. Govt. Print. Off., 1955. 248 p. tables. (no. 14; code 415.)

Contains detailed hull, machinery, and electrical specifications for this diesel-powered cargo ship designed for arctic and cold weather operations. The bow profile is designed similar to that of an ice-breaker, and features a closed, heated ice pilot station with remote control equipment for navigating in ice. The ship is approximately 266 ft. long with a load capacity of 1,300 tons. Useful index is added.

48621. U. S. MILITARY SEA TRANS-PORTATION SERVICE. MSTS Office, St. John's. (*Its:* MSTS magazine, May 1956. v. 6, no. 5, p. 6–7, illus.)

Port facilities and operations of the Military Sea Transportation Service office at St. John's, Newfoundland, are described briefly. The port is normally ice-free throughout the year but heavy precipitation and fog are common. The office serves as forward echelon for summer resupply operations to arctic military bases.

Copy seen: DLC.

48622. U. S. MILITARY SEA TRANS-PORTATION SERVICE. MSTS Office, Whittier. (*Its:* MSTS magazine, July 1956. v. 6, no. 7, p. 14–15, illus., map.) Facilities and operations of this port are described briefly. It is a major year-round center for military passengers and cargo destined for coastal and interior Alaska. Connections with the Interior are made by the Alaska Railroad. In addition to the railroad terminal, the port contains two main Army buildings, a sawmill, and several commercial offices. A large apartment building is nearing completion which will house military dependents. Copy seen: DLC.

48623. U. S. MILITARY SEA TRANS-PORTATION SERVICE. Polar study made of cosmic rays. (*Its:* MSTS magazine, Oct. 1953. v. 3, no. 10, p. 19–20, illus.)

High altitude cosmic ray observations sponsored by the Office of Naval Research and made from the Navy ice-breaker Staten Island near the North Magnetic Pole are described briefly. The operation, called Project Muskrat, utilized rockets fired from balloons after reaching altitudes of 50,000–70,000 ft. The rocket reached an altitude of 295,000 ft. during tests in the summer of 1952.

Copy seen: DLC.

48624. U. S. MILITARY SEA TRANS-PORTATION SERVICE. Prefab dock offers super-service in a hurry. (*Its:* MSTS magazine, Oct. 1953. v. 3, no. 10, p. 4–6, illus.)

The construction and installation of prefabricated steel docks at Thule, northwest Greenland, during Operation Blue Jay are described. The sections were fabricated in Texas and towed like barges to the permanent dock site. This type of dock is particularly suitable for use in the Arctic since it requires about 10 percent of the time and a smaller percentage of the labor required for the conventional construction. The dock placed at Thule consisted of four 50 x 250 ft. sections placed end to end.

Copy seen: DLC.

48625. U. S. MILITARY SEA TRANS-PORTATION SERVICE. Resolute Redbud is a tough little ship. (Its: MSTS magazine, May 1956. v. 6, no. 5, p. 19. illus.)

p. 19, illus.)
The USNS Redbud is described briefly.
The 1,025-ton ship is classified as a light cargo carrier-icebreaker and is powered by a 1,200 hp. diesel-electric engine. It is used for preliminary charting of the ice pack and other advance work required

for the annual arctic resupply operations in the North Atlantic-Baffin Bay area.

Copy seen: DLC.

48626. U. S. MILITARY SEA TRANS-PORTATION SERVICE. Steel piers installed at Whittier. (*Its*: MSTS magazine, May 1954. v. 4, no. 5, p. 17.)

Two DeLong-type prefabricated piers were installed at Whittier, Alaska, in Oct. 1953 to replace facilities destroyed earlier by fire. The steel barges forming the piers were towed from Charleston, S. C., and Austin, Tex.; 16 men working three weeks readied the units for partial operations. The barges measured 427 x 90 x 15 ft. and 250 x 60 x 10 ft.

UNITED STATES NATIONAL COM-MITTEE FOR THE INTERNATIONAL GEOPHYSICAL YEAR. See under International Geophysical Year, 1957–1958. U. S. National Committee.

48628. U. S. NAVAL CIVIL ENGINEERING RESEARCH AND EVALUATION LABORATORY. Port Hueneme, Calif. Snow-removal operations, winter 1952–53. Port Hueneme, Calif., Aug. 25, 1953. 6 p. l., 57 p. 4 fold. charts, photos. (Its: Project NY 012 021–1. Technical memorandum M-047.)

The most suitable equipment and techniques for snow removal from airstrips, access roads and building areas were investigated. The most effective commercial blade-type unit for high-speed air-strip clearance incorporates a high-speed mover with a reversible high-mold-board plow controlled from the cab. The most satisfactory commercial rotary-type

unit is an auger-type plow mounted on a four-wheel drive, four-wheel steer incorporating a double reduction axle. Standard commercial equipment does not fully satisfy military requirements and suitable design modifications should be undertaken. Detailed characteristics and photographs of the equipment, and a simplified classification of natural snow types for engineering purposes are appended. The tests were conducted at the Sierra Test Site at June Lake, Calif. Maintenance charts covering equipment tests are included. Copy seen: AMAU.

48629. U. S. NAVAL CIVIL ENGINEERING RESEARCH AND EVALUATION LABORATORY. Port Hueneme, Calif. Snow-removal operations, winter 1953-54. Port Hueneme, Calif., Oct. 15, 1954. 3 p. l., 50 p. 2 fold. diagrs., illus., 4 tables. (1 fold.). (Its: Project NY 012 021. Technical memorandum M-094).

Tests were carried out at the Brunswick Naval Air Station (Me.) on reversible-type blade plow, rotary snow-plows; torque-converter units, one-way blade-type plows with wings, sand spreaders and a "payloader." The group of equipment tested was considered adequate for the area insofar as major units were concerned. The equipment is illustrated, and test results are discussed for each unit. An operating performance chart is included together with a schematic of the snow-removal plan for the airfield.

48632. U. S. NAVAL PHOTOGRAPHIC CENTER. Cold weather photography. Washington, D. C., Dec. 1, 1955. xviii, 118 p. illus., diagrs., tables. (*Its*: NAV-AER 10-1-752.)

The effects of temperature, weather, and light conditions in polar areas on photographic techniques, supplies, and equipment are described in detail. Special winterization procedures are outlined which must be followed before equipment is used in cold areas. Light conditions over snow or ice may introduce special problems due to lack of contrast and multiple reflection. Exposure meters are reliable and indispensable for good results in polar areas. Special problems related to processing and storage are also discussed. Aerial, motion picture, and still cameras used by U. S. Navy on cold weather operations are listed, and general cold weather ratings, cold weather malfunctions, and special features are indicated. Foreword, contributed by the Photographic Interpretation Center, stresses uses of aerial photography peculiar to cold regions: in mapping, forecasting, identification of terrain characteristics, etc. Copy seen: DLC.

48633. U. S. NAVAL PHOTOGRAPHIC INTERPRETATION CENTER. Aerial photo analysis of permanently frozen ground. [Washington, D. C.] Pub. by direction of the Chief of the Bureau of Aeronautics, Dec. 1, 1950. vii, 71 p. diagrs., illus., tables, text map. (Its: NAVAER 10–35–562.) 121 refs.

"The terrain features which are identifiable from the air as indicators of permafrost soil conditions are described and illustrated. Included are the various types of polygons, and related features such as peat mounds, pingos, surface water, icing, thermokarst, solifluction, river terraces, landslides, frost cracks, and minor superficial folds. A list of preferred and synonymous technical terms related to permafrost and polygonal phenomena and a bibliography are appended."—SIPRE.

е

, f

s

A compilation of geographic information, primarily for military planners and engineers, on the Canadian mainland, north roughly of 55° N. and on Hudson Bay and Baffin Island. Introductory survey is offered (p. 1-15) of the area as a whole, and its subdivisions. The latter are subsequently treated in turn: Yukon, Mackenzie, Keewatin, Baffin Island, "arctic" parts of each province from British Columbia eastward to Quebec and Labrador, etc. Physiography, geology, climate, soil conditions, flora and fauna, hydrology, agriculture, mineral resources, transportation facilities, etc., are stated; detailed descriptions are added of the lake and river basins and the settlements; air photos augment the text. Hudson Bay and Strait: climate, ice conditions, and oceanography are presented by Jesse A. Mann (p. 235-46). The north coast of the Canadian mainland: topography, bays, harbors, rivers, etc. is treated by John C. Martin (p. 341-403). The geology of northern Canada is described by J. Tuzo Wilson (p. 403-424). Selected bibliographies for various regions, and subjects of military studies are appended.

48637. U. S. OFFICE OF NAVAL OPERATIONS. Marine climatic atlas of the world, v. 1; North Atlantic Ocean. Washington, D. C., U. S. Govt. Print. Off., Nov. 1, 1955. xvii, 275 p. of maps 35 x 51 cm. (Its: NAVAER 50-1C-528.) 31 refs.

Climatic data for the ocean area from the Equator to approximately 70° N. lat., are presented in graphs, tables, and maps by month and season. Marine observations are supplemented by data from five coastal stations above 60° N. due to the paucity of ship observations in the Arctic. Both surface and upper air data are presented. Emphasis is placed on graphical representation of frequency distribution of individual climatic elements. Copy seen: DLC.

48638. U. S. OFFICE OF NAVAL OPERATIONS. Operational weather of the Northern Hemisphere. [Washington, D. C., U. S. Govt. Print. Off.] May 1, 1955. 2 pt.: vii, 82 p.; 90 p. maps. (NAVAER 50-1C-527A.) 108 refs.

Climatology handbook designed for

operational use, covering two major geographical areas: the Mediterranean, and the Eastern Atlantic-Western European, the latter extending to approx. 80° N. lat. The climatology of these areas is first presented in the traditional manner with standard data for four typical months representing the seasons. In pt. 2, data are reworked and regrouped into a synoptic climatological form for ready reference by the practicing meteorologist. Major emphasis in the synoptic discussion is given to the time and spatial distribution of blocking formation. Copy seen: DLC.

48639. U. S. OFFICE OF NAVAL RESEARCH. Navy cold weather clothing. (Its: Research reviews, Sept. 1956, p. 7-8.)

Winterized clothing adopted officially for naval service in early 1951 is described. The clothing is composed of two basic outfits which are worn together when used in the Arctic. The outer outfit utilizes the double-moisture-barrier principle by enclosing the insulating material between two layers of waterproof, neoprene-coated nylon twill fabric. Threedimensional design features in the clothing are obtained by the use of heavy ridged seams on the jacket arms and sides, and the use of side panels. Nomenclature and description of the clothing are given. Copy seen: DLC.

48640. U. S. OFFICE OF NAVAL RESEARCH. Shipboard ice remover made from pulse-jet engines. (Its: Research reviews, Nov. 1956, p. 11, illus.)

The de-icer burner, originally designed for digging post holes in frozen ground, was modified to remove ice from rigging, winches and other topside equipment of ships. The de-icer consists of a pair of 2.5-in. O. D. valveless pulse-jet engines operating 180° out of phase. Combustion 'gases are collected in a common pressure chamber and passed through an exhaust nozzle. The de-icer weighs less than 12 lb. and can penetrate 7.5 in. of hard ice in one min. Copy seen: DLC.

48641. U. S. OFFICE OF ORDNANCE RESEARCH. Interservice Vehicle Mobility Symposium, held at Stevens Institute of Technology, Hoboken, N. J., 18-20 April 1955. Conducted for the Corps of Engineers, Transportation Corps, and the Ordnance Corps of the U. S. Army. Durham, N. C., 1955. 2 v. Vol. 1 (xxi, 81 l.) contains the minutes,

abstracts and discussions of this Symposium. Vol. 2, pub. by the Land Locomotion Research Laboratory, Detroit Arsenal, Center Line, Mich. (8 p. l., 175 p.) contains 23 papers delivered at its sessions. Six of them particularly relevant to northern conditions are abstracted in this Bibliography under their authors' names, viz.:

48643. U. S. QUARTERMASTER FOOD AND CONTAINER INSTITUTE FOR THE ARMED FORCES, Chicago. Nutrition under climatic stress; a symposium, Washington, Dec. 4-5, 1952. Edited by Harry Spector and Martin S. Peterson. Washington, D. C., National Research Council, 1954. vi, 204 p. illus. tables.

A review, by research workers, of the

relationship between nutrition and extremes of climatic stress, cold or torrid. The proceedings were expected to provide a compendium of information on special nutrition for the Armed Forces. The material is presented in four groups, with papers concerning cold environment as follows:

Practical problems of Service operations, includes cold climate feeding in Canadian operations by J. G. Armstrong (p. 8–12), dealing with rations, their package size and composition, water; physiological responses of man to cold (or heat) by F. Daniels, Jr. (p. 18–32), covering heat loss, temperature regulation, and reactions to cold.

Animal experimentation, includes an essay on acclimatization to cold, by L. P. Dugal (p. 70–81) based on experiments with guinea pigs, monkeys, etc. and centering on the role of ascorbic acid in this process. E. P. Ralli discusses the effect of some vitamins on man's response to cold (p. 81–90). Protein metabolism in cold or torrid environment is discussed by B. F. Chow and others (p. 91–97). Finally, Sir Hubert Wilkins advances general, practical suggestions on food during arctic expeditions (p. 102–107).

Human experimentation, contains a report by H. H. Mitchell on laboratory studies on nutrient requirements during climatic stress (p. 108-129); and an account of field tests in nutrition and climatic stress by F. Sargent, II.

Present knowledge and research needs are discussed by H. Pollack in a review of lessons from Korea (p. 168-76); E. Pagé reviews the requirements in major nutrients during cold exposure (p. 183-91) and A. Keys and some participants discuss organization and coordination of research (p. 195-203). Each of the four sections contains summary remarks and discussions of the problems presented. Bibliographies follow the individual papers.

48646. U. S. WEATHER BUREAU. Maximum snowfall depth at selected stations in Canada and Alaska. [Washington, D. C.] 1942. 1 p., table. Typescript. (Its: Special report 106.)

Maximum 24-hr. snowfall for each month at four Canadian stations (among them Watson Lake and Whitehorse, Yukon) and Fairbanks, and maximum snow depth on the ground for each month at Fairbanks are tabulated. The depth of snow at the end of each month is also tabulated for Fort Nelson, B. C., and Fairbanks. No period of record is given.

\*\*Copy seen: DWB.\*\*

48647. U. S. WEATHER BUREAU. Monthly climatic data for the world by continents. Washington, D. C., May

1948-Dec. 1955. 8 v. tables.

Mean monthly data are given for some 700 stations including a few in Alaska, northern Canada, Greenland, Iceland, and in arctic and subarctic areas of Sweden, Norway, and the U. S. S. R. Data include surface temperature, pressure and humidity, total precipitation, and the quintile of the frequency distribution for the precipitation. Upper air data given include the height, temperature, and dew point of the standard

pressure levels. The latitude, longitude, and elevation of the stations are also included. **Copy seen:** DLC.

48648. U. S. WEATHER BUREAU. Plans for installation of joint Canadian-U. S. satellite meteorological stations at Isachsen Land and Prince Patrick Island, N. W. T., Canada. Washington, D. C., 1948. 45 p.

Contains general instructions for personnel engaged in the operations for establishing weather stations during 1948 near 78°50′ N. 104°50′ W. and 76° N. 121°30′ W. Included are schedules of operations, air reconnaissance, preparation of supplies, plane loadings and cargo priorities, initial flights, communications, command, organization, personnel and maintenance duties, emergency procedures, and camp construction and maintenance.

48649. U. S. WEATHER BUREAU. Report on airlift operations Spring 1950 to joint Canadian-United States weather stations, Isachsen, Mould Bay, Eureka, and Alert, Northwest Territories, Canada. Washington, D. C., Sept. 1950. 62 p. 17 illus., port., text map, 2 diagrs.

Resupply of Isachsen, Mould Bay, and Eureka (125 tons supplies, replacement personnel) is reported, also establishment of a new station at Alert (airlift of 300 tons and 12-man staff). The first two stations were supplied from Resolute, the others from Thule, Mar. 18-June 12. Preparations, actual operations, and construction of airstrips at the stations are described; operations statistics are presented. Recommendations (with diagrs.) for preparation of ice airstrips are appended (p. 49-60).

Complications involved in the truck-type gas generator operated on peat brickets and pieces, 6-18 percent ash, are discussed in detail. Ashes melt into slag at temperature over 900° C., cover the grating and reduce gas production. Modification introduced in the furnace construction, especially for periodic shaking of the grating, considerably improved operation of the truck, without poking and slag removing, for 150-350 km. The ZIS-150 automobile made a 400 km. trip without reloading on brickets and one 600 km. on wood blocks.

48652. URAZOVSKIĬ, S. S., and P. A. CHERNIĀVSKIĬ. Ob osobennostiākh v temperaturnoi zavisimosti viāzkosti pereokhlazhdennykh zhidkostel. (Akademiā nauk SSSR. Doklady, Nov. 21, 1956. t. 111, no. 3, p. 640-43, table, diagr., graph.) 6 refs. Text in Russian. Title tr.: Specific relation of temperature and viscosity of supercooled liquids.

The studies of anomaly in viscosity of oils and petroleum fractions are reviewed with special attention to supercooled liquids. Variation of viscosity is studied in the viscosimeter of high precision equipped with electronic amplifier. The time was recorded within 0.01 sec. and temperature within 0.01° C. The results are tabulated and graphically illustrated. Volumetric increases of viscous liquid in the supercooled phase are explained by formation of kinematically stable aggregates of few molecules, genetically corresponding to the crystallic phase and differing among themselves by number of molecules and their orientation.

"The formation of ice crusts and the effects of their thickness and structure on meltwater run-off were studied at Valday Hydrological Station in 1952-1955. Run-off increase (to 50 percent) was observed only over a thick ice crust (50 mm. or more). Ice crusts on vegetation-covered slopes melted rapidly around the plants, permitting meltwater penetration under the ice and absorption even by frozen soil. same effect was observed for broken ice crusts. Snow-covered ice crusts, increase greatly in thickness after thaw weather and the rough upper surface becomes smooth after thaws."-SIPRE.

Text in Russian. Title tr.: On the biology and ecology of blackflies (Diptera, Simuliidae) of Karelian ASSR and Murman province.

Eight types of water basins, from large valley rivers (type 1) to very small streams (type 8) are characterized, on the basis of investigations around Petrozavodsk (Karelia) and Kirovsk (Kola Peninsula). Data are presented on the distribution of larvae and pupae of these blackflies or gnats, and on their migrations in the basins. The factors which affect this family of biting flies are three: those (chiefly temperature) which determine the specific content of the population; factors influencing its size, such as rate of flow and transparency of the water, bottom characteristics, oxygen content and light; chemical characteristics (acidity, alcalinity) also greatly influence development in the aquatic phases of their life. Based on field work conducted during 1952–1954 in the Petrozavodsk, Kirovsk and the River Lizhma areas. The localities are described; ways of egg deposition, effect of environmental factors on the eggs (low temperature, dryness, etc.), biology of blackflies during the winter are dealt with. Number of generations, phenological data and development of blood-sucking activity of the adults are reported, with consideration of the effect of different factors on this activity.

48668. UZHIK, GEORGIĬ VIKTORO-VICH. Prochnost' metallov pri nizkikh temperaturakh. (Akademiâ nauk SSSR. Vestnik, Aug. 1956. god 26, no. 8, p. 9–14, graphs.) Text in Russian. *Title* tr.: Strength of metals at low temperatures.

Existing methods of determination of mechanical properties of metals are analyzed in respect to rational evaluation of their resistance and strength under effects of low temperatures. Brinell shock test at different temperatures is often used for indication of the "shock elasticity" at the "critical" (lowest) temperature. This method is not satisfactory in practice, because the strength is increased and elasticity reduced at lower temperatures. The elasticity is defined by combination of dynamic stress and deformation. Two metals may have different stresses and deformations, but the same "shock elasticity." The author suggests that the metal be evaluated by its sensitivity to changes in shearing resistances with lower temperatures and that the rational method be developed further for this characteristic.

Contains an historical account of one of Russia's oldest scientific societies prepared in celebration of its 150th anniversary (1805-1955) and the 200th of Moscow University (1755-1955), closely associated with the Society from its beginning. Founded in 1805 by Prof. G. J. Fischer von Waldheim and a group of professors of the University, the Society has had an important part in the promotion and dissemination of science, especially natural history, in Russia. It has published several scientific journals (Bulletin, Journal, Mémoires, Nouveaux mémoires, Zapiski, and Vestnik estestvennykh nauk) earlier in French, latterly in Russian; and it has sponsored many expeditions

for study of the geology, paleontology, botany and zoology of Russia. The most important of these was the botanical expedition of G. S. Karelin and J. P. Kirillov into central Asia (Altay Mts., Dzhungaria and Semirech'ye) in 1839-41 (p. 21-25). The first exploration of Kamchatka Peninsula by O. Khun'in 1808, and G. J. Langsdorff in 1812, and the investigation of Ural Mts. by G. E. Shchurovskii in 1838, were also sponsored by the Society. Biographical notes on its presidents and on many prominent scientists and explorers are included. Changes in the Society's organization and activities in the Soviet period are described (p. 70-100). At present, it has three large groups (otdely): Biological, Geological-geographical, and Agricultural, which are subdivided into 16 sections (zoological, botanical, anthropological, etc.). The role of the Moscow Society of Naturalists during the 150 years of its existence has been so outstanding that it can be compared only with that of the Academy of Sciences of the U.S.S.R. tering of plants.

Contains a study of current ideas on the wintering of plants and their practical application, based to a great extent on author's studies in various Soviet regions, including subarctic areas. Part 1 (p. 5-83) deals with early and recent notions on freezing of plants; the effects of cold, moisture and ice cover; of winter dryness and wind, etc. Pt. 2 (p. 84-211) covers the problem of cold resistance (hardiness) and external factors determining it (temperature, humidity, light, etc.); the effect of autumn growth on hardiness; reserve substances, water content, pH, colloidal changes, conditions of growth, winter rest, and other factors as they affect cold resistance; principles of increasing the hardiness of plants. Pt. 3 (p. 212-61): cold resistance in nature and plant culture; its characteristics; types of hardy plants; creation of winter resistance; role of hybridization and selection in this process; role of nutrition; etc.

Copy seen: DLC.

48692. VASIL'EV, VIKTOR NIKO-LEAVICH, 1890—. Rastitel'nost' Anadyrskogo krafi. Moskva, Izd-vo Akademii nauk SSSR, 1956. 218 p. illus., tables, fold. maps. 76 refs. Text in Russian. *Title tr.:* The vegetation of the Anadyr' land.

A study based on work of the 1932– 1933 Chukotsk-Anadyr' Expedition of

the Far Eastern Bureau of Goszemtrest. on which the author led the four-man geobotanical party. He aimed to complement work of others in 1931-32 mainly on the forest tundra (cf. No. 17728, 12159, 12152). His itinerary was from the Anadyr' estuary to Markovo, thence into the Mayn basin, and to Lake Krasnoye, the Belaya River and Mukhomornaya River to Markovo. Introductory survey is given (p. 1-22) of expeditions in the area, its physical geography, location and size, rivers and lakes, climate. early glaciation. The plant cover is treated in detail (p. 23-178), its general character, phytocoenotic types and their component species: mountain tundra: shrub, typical, and lowland tundra; vegetation of the valleys; deciduous foresttundra. Following brief account of forest and hay sources, classification of the stands of Siberian larch (Larix dahurica) in the Anadyr' basin is dealt with (p. 179-95); and aims stated in further geobotanical studies of the area. Plants included in the study are indexed, also taxonomically grouped, at end. The study had a practical purpose, viz. to determine food sources and possibilities for reindeer farming. Copy seen: DLC.

48693. VASILEVICH, GLAFIRA MAKAR'EVNA, 1895— . Évenki. (*In:* Akademíñ nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 701–741, illus. incl. plates.) 78 refs. Text in Russian. *Title tr.:* Evenki.

This Tungus people, reindeer-herders in the north, cattle-breeders or farmers in the south, are most numerous and dispersed of all the so-called small peoples of the North: over a 21/2-3 million sq. km. area from the Yenisey, Nizhnyaya and Podkamennaya Tunguska northeast to the Lena River and Laptev Sea, and south to Lake Baykal and Mongolia. Their history, economy, and culture generally are described; and population statistics for 1926 are given: 38,804, excluding the settled Evenki farmers of Their tribal the Trans-Baykal region. divisions, warfare and blood feud, trade relations, etc. with the Russians are described. Their class society, relatively high position of women, marriage customs (levirate practiced but union of elder brother with widows of younger brothers prohibited), their religious beliefs (animism, shamanism, cosmogony, bear cult), folklore and music are treated in turn. Post-Revolution changes in these customs and social organization are discussed in conclusion: the territorial administration, settling of nomad groups, collectivization, kolkhoz economics, and selected statistical data are given. New medical services and educational facilities are noted. Modern Evenki writers and artists are named and their works cited. The collaboration of A. V. Smolfak and use of the late N. P. Nikul'shin's materials are acknowledged.

(Gidrotekhnicheskoe stroitel'stvo, Apr. 1956. god 25, no. 3, p. 37-39, table, graphs.) ref. Text in Russian. Other authors: Th. L. Gotlib, E. E. Zalmin, N. I. Smolin, and A. K. Klimenko. Title tr.: Study of ice-jams and computing their maximum levels for design of a hydro-electric station.

Ice jams in the upper stretches of the Angara River were studied from 1949-1954 to assess winter operating conditions for a hydro-electric plant. Mathematical analysis of the data collected shows an increase in the intensity of underwater ice formation with decrease in air temperatures. The amount of underwater-formed ice was also proportional to the duration of ice-jam formation. These functional interrelations and their effects on waterlevel variations are calculated for the temperature range between the freezing point and -37° C. The functional dependence of ice-jam intensity on air temperatures and the duration of frost action was also determined for other parts of the Angara. Copy seen: DLC.

Contains an annotated list of 28 species of birds collected or observed mostly in the vicinity of Magadan. The local avifauna is of three main kinds: birds native to more southern regions, species common in tundra and tundra-forest zones, and alpine species common in the mountain belt of eastern Asia. Copy seen: DLC.

48698. VAUGHAN, ELIZABETH. Time of appearance of pink salmon runs in southeastern Alaska. (Copeia, Apr. 20, 1947, no. 1, p. 40–50, 4 diagrs., 2 tables.)

Contains study of observed changes in the time of the runs. Pink salmon (Oncorhynchus gorbuscha) may be divided into two distinct populations: that of even and odd years. The migration of adults occurs in July, August and part of September. From daily catch records, the date by which 75 percent of the trap catch was made, has been computed and used as an index of the time of the run. Truncation dates for 22 sections of the region are tabulated, also index values for years 1926 through 1944.

Copy seen: DLC.

48699. VAUGHAN, ELIZABETH. The use of catch statistics for estimating parameters of the pink salmon migration pattern in Icy Strait. (*In:* Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 78–86, diagrs., map.)

A study undertaken to determine whether the spawning migration of pink salmon follows a definite pattern of distribution from year to year, and if so, to appraise this distribution. Avenues and periods of migration, catch statistics since 1908, etc., are evaluated, and statistical data are used for developing a mathematical procedure "valuable in deriving indices of the spawning migration."

48700. VAUGHAN, JOHN A., and F. DANIELS, Jr. The physiology of load carrying, IX; the energy cost of sled pulling by one man. Natick, Mass, 1956. 25 p. illus., tables, graphs, appendices A-D. (U. S. Quartermaster Research and Development Command. Environmental Protection Division. Technical Report EP-26.) 23 refs.

"The energy cost of sled pulling and the drag imposed by the sled has been measured with net loads ranging from 53-196 lb. on the 200-lb. capacity plastic boat-type sled. The relationship between load and drag under the conditions of level snow in treeless areas at air temperatures from about 0°-40° F. is approximately linear and a prediction formula has been calculated. formula has been derived to estimate energy expenditure from drag. The data show that the mechanical components of softness and depth of snow result in greater physiological strain than the frictional elements due to low snow temperature or grain form. The effects of snow temperature could not be clarified in the relatively small temperature range studied. The snow characteristics. of course, affect the man's traction as well as the drag resistance of the sled. Evidence is presented that a pay load of 125 lb. (15 lb. pull) at a speed of 2 mi./hr. can be considered an "optimum" compromise between work accomplished and physiological strain in sled pulling by one man over level snow."-Author's abstract. Copy seen: DNLM.

48701. VAURIE, CHARLES. Systematic notes on palearetic birds; no. 21, Fringillidae: the genera Pyrrhula, Ephona, Coccothraustes, and Mycerobas; no. 23, Fringillidae: the genera Emberiza, Calcarius, and Plectrophenax. New York, 1956. 2 pt.: 24 p.; 27 p. (American Museum of Natural History, New York. American Museum Novitates, no. 1788, no. 1805.)

Includes (in no. 21) critical notes and graphic illustration of geographical variation in wing length of Pyrrhula pyrrhula occurring in Arkhangel'sk province; two varieties of this species, jenisseiensis (Yenisey River) and cassini (Kamchatka) are discussed. No. 23 deals with three species of Emberiza, from Yakutia, the Anadyr' region and Kamchatka; also Calcarius lapponicus (Lapland and Greenland) and its varieties in the Commander Islands, Kamchatka and Alaska; and

with Plectrophenax nivalis, six subspecies occurring in Greenland, Lapland, Pribilof Islands, the Aleutians and Vrangel Island. The earlier parts of this series which include arctic material are listed as No. 38055 and No. 43143 of Arctic Bibliography.

48702. VDOVIN, INNOKENTIĬ STE-PANOVICH. K istorii obshchestvennogo strofa chukcheľ. (Leningrad. Universitet. Uchenye zapiski, no. 115, 1950. Fakul'tet narodov Severa, vyp. 1, p. 73–100.) 35 refs. Text in Russian. *Title tr.:* History of the social organization of the Chukchis.

Historical outline of the Chukchis from their first appearance on Chukotka in the first millenium A. D. through the 19th century. Influence of indigenous Eskimo culture, relationship and continuous armed conflicts with Koryaks, Yukaghirs and, later, Russians are noted. Their original reindeer hunting and later reindeer herding and sea mammal hunting economies are described. marriage customs, the transition from matriarchate to patriarchate and progressive rise of class distinction, based on reindeer ownership, are discussed. Paper presented at the Northern Conference at Leningrad, Dec. 10-14, 1947.

48703. VEBÆK, CHRISTEN LEIF. Mellembygden. (Grønland, Mar. 1956, nr. 3, p. 92-98, illus., map.) Text in Danish. *Title tr.*: Mellembygden.

Excavations were carried out in summer 1954 by the writer's five-man party in the area around Arsuk-Ivigtut, West Greenland. This area, called Mellembygden by archeologists, was probably the northwesterly outpost of the Norsemen's communities in Østerbygden (the Julianehåb district); 22 groups of ruins and six separate houses are known. Three sites were excavated; little remains of the houses and finds were few. The area was probably abandoned some time after Vesterbygden, in the Godthåb district, was (1370) but before the destruction of Østerbygden. Copy seen: DLC.

48704. VEBÆK, CHRISTEN LEIF. Vatnahverfi. (Grønland 1953, hefte 6, p. 219–24, illus., map.) Text in Danish. Title tr.: Vatnahverfi.

Contains a survey of excavations in Vatnahverfi (the lake area); settled by the Norsemen, it is situated in the inner part of a peninsula between Igaliko Fjord (60°45′ N. 45°30′ W.) and Agdluitsoq Fjord (60°30′ N. 45°30′ W.) West Greenland; 35–40 farmsteads and two churches are known in the area. Some of the finds made during the Danish National Museum's expeditions in 1949 and 1950, of which the author was a member, are described.

VEER, GERRIT DE, fl. 16th century. see Pasetskif, V. M. Villem Barents. 1956. No. 47266.

48705. VEGARD, LARS, 1880—, and G. I. KVIFTE. An auroral spectrogram and the results derived from it. Oslo, Grøndahl & søn, 1951. 23 p. diagrs., tables. (Geofysiske publikasjoner, v. 18, no. 3.) 14 refs.

A spectrogram obtained with a newly-designed instrument during a brilliant auroral display at Oslo on the night of Feb. 23–24, 1950, is reproduced, and the auroral lines are interpreted. The spectrograph remained in the same position, and the exposure lasted for nearly 10 hrs. About 114 bands and lines were measured with a comparator directly from the negative; more than 50 were not previously detected. Greater magnification indicated the total number of measured bands and lines amounted to about 375, about 310 of which had not been detected or measured previously.

48708. VEĬNBERG, BORIS PETRO-VICH. Chislovye kharakteristiki uslovii prevrashcheniiā vodiānogo para i zhidkoī vody v tverdoe sostolānie. (*In his and* others: Led . . . 1940, p. 92–170, 496–500, 510–11, illus., tables, diagrs., graphs) 198 refs. Text in Russian. *Title tr*: Numerical characteristics of conditions for transformation of vapor and liquid phases of water into the solid state.

The thermodynamics of phase transformation are discussed including the specific heat of ice and supercooling of Data on the heat of fusion and densities of fresh- and salt-water ice at various temperatures and salinities are reviewed from 1870. Spontaneous crystallization of supercooled water is described and crystal formations are depicted. A mathematical analysis of the friction of ice with experimental data on the resistance of sled runners to ice is included. Copy seen: DLC.

48709. VEĬNBERG, BORIS PETRO-VICH. Genezis i osobennosti razlichnykh form vodnogo l'da. (*In his and others*: Led . . . 1940, p. 347-70, 500-510, illus., tables, graphs.) 47 refs. Text in Russian. *Title tr*: Origin and characteristics of ice formed on water surfaces.

Precipitation of ice in various forms is described with reference to the causes of formation and their physical characteristics. The formation of ice in waters is classified according to place of formation (ponds, lakes, rivers, streams, sea, etc.) and the type of physical processes (initial ice cells, local surface growth, slush, sludge ice or "shuga", bottom ice, etc.). Thermal conditions preceding ice formation in water are analyzed. Ice formation in sea water is described in the

appendix (p. 500-510) with consideration of salinity and porosity of ice structure and expressed and illustrated on the basis of data given in five tables.

48710. VEĬNBERG, BORIS PETRO-VICH. Genezis i osobennosti razlichnykh vidov sublimatsionnogo l'da. (In his and others: Led . . . 1940. p. 314-38, illus., table, diagr.) 46 refs. Text in Russian. Title tr: Origin and characteristics of ice formed through sublimation.

Sublimated ice and its formation in the atmosphere are described with reference to the literature and the author's observations. Ice clouds with concentrated super-saturation and crystallic fog over dry areas stimulate the fall of crystals and droplets. Sizes and forms of snow flakes and ice crystals are related to meteorological conditions during their fall. Conditions for various types of precipitation (snow flakes, granular snow, hoarfrost, sleet, etc.) are outlined. Dendritic ice formations on glass windows are analyzed.

Ice velocities in various glaciers are analyzed on the basis of previous observations. Average velocities at cross-sections of different glaciers are graphically represented. Kinematics of glacier movements are discussed and analytically formulated.

\*Copy seen: DLC.\*

48713. VEÏNBERG, BORIS PETRO-VICH, and A. F. KAZANSKII. Mekhanicheskie, opticheskie i drugie svoïstva l'da. (In: Veïnberg, B. P., and others: Led . . . 1940. p. 171–227, 511–16, illus., tables, graphs, diagr.) 119 refs. Text in Russian. Title tr.: Mechanical, optical and other properties of ice.

The classification of the mechanical properties of ice is criticized; a new classification based on the elastic, plastic, and brittle properties is suggested. The plasticity of ice is discussed on the basis of the relaxation theory. Determinations of Young's modulus of elasticity for ice by various investigators are reviewed, tabulated and compared with Poisson's ratio. The behavior of ice under a load in excess of the elastic limit is mathematically formulated and is related to the internal friction of ice. Experimental results of ice plasticity by other investi-

gators are summarized, and data on the electrical, magnetic and optical properties of ice are tabulated and graphed.

48714. VEÏNBERG, BORIS PETRO-VICH, and others. Nekotorye svoſstva snezhnogo pokrova. (In his and others: Led . . . 1940. p. 239–58, tables, graphs.) 47 refs. Text in Russian. Other authors: S. M. Gorlenko and A. B. Dobrowolski. Title tr.: Some properties of the snow cover.

The mechanical and physical properties of snow (density, cohesion, friction, strength, etc.) are tabulated for various forms of snow. Difficulties in determining these properties are described and the factors affecting them are discussed.

Copy seen: DLC.

48715. VEÏNBERG, BORIS PETRO-VICH, and others. Obshchaîa kristallografiā l'da. (In his and others: Led... 1940. p. 259-84, illus., diagr.) 52 refs. Text in Russian. Other authors: M. P. Golovkov, and A. B. Dobrowolski. Title tr.: General crystallography of ice.

Contains general review of various snow-crystal classifications of various investigators since 1847. The crystal-lography of fresh- and sea-water ice is discussed with respect to the various structures.

Copy seen: DLC.

48716. VEĬNBERG, BORIS PETRO-VICH, and others. Obshchaſa petrografiſa l'da. (In his and others: Led . . . 1940. p. 285-94, illus., diagr.) 3 refs. Text in Russian. Other authors: A. B. Dobrowolski and M. P. Golovkov. Title tr.: General petrography of ice.

Magmatic ice varieties are described and divided into three types: I, ice originated in solid magma (lake ice, shuga and underwater ice); 2, ice from particle magma (hoarfrost); and 3, ice in frozen ground. The discussion on precipitated ice varieties includes: snow cover (crystallic), firn snow, firn ice and glacier ice. Petrography of ice in the Kara Sea is described, including a diagram of interrelation of different textures and structures of ice, such as grain, pseudo-grain, foliated, columnar (basaltic), vesicular, fibrous and laminated.

Copy seen: DLC.

.48717. VEĬNBERG, BORIS PETRO-VICH, and others. Rost i ischeznovenie lediânogo pokrova. (In his and others: Led . . . 1940. p. 392-409, illus.) 33 refs. Text in Russian. Other authors: A. A. Shepelevskii and V. I. Arnol'd-Alfâb'ev. Title tr.: Growth and disappearance of ice cover.

The change in ice thickness with time is mathematically expressed based on J. Stefan's work on the growth of ice in water and using a correction for ice surface temperature due to changes in air temperature. The thickness of ice is computed with geophysical, thermo-physical and climatological-empirical formulas. The thawing process with and without snow cover is indirectly related to the freezing method. Ice formed from slow crystallization, also disintegrates by decomposition of the crystals.

Copy seen: DLC.

48718. VEÏNBERG, BORIS PETROVICH, and S. M. GORLENKO. Snezhnyl pokrov i ego dinamika. (In: Veĭnberg, B. P., and others: Led . . . 1940. p. 410-40, illus., table, graph, diagr.) 28 refs. Text in Russian. Title tr.: Snow cover and its dynamics.

Characteristics of fresh and old snow covers are described with the classification tables given by W. Paulcke, Seligman and A. V. Molochnikov. Various shapes of snow drift formations behind obstructions are analyzed and illustrated.

Copy seen: DLC.

48719. VEĬNBERG, BORIS PETRO-VICH. Termodinamika prevrashchenifa vody. (In his and others: Led . . . 1940. p. 13–91, illus., tables, diagr., graphs.) 58 refs. Text in Russian. Title tr.: Thermodynamics of water transformation.

Ice forms are classified and defined and their geophysical significance is discussed. The physical changes of water on freezing are mathematically expressed with the three phases, ice-water-vapor, considered in turn. The theory of regelation is explained.

\*\*Copy seen: DLC\*\*

48720. VEÏNBERG, BORIS PETRO-VICH. Vozniknovenie l'da v atmosfere. (In his and others: Led . . . 1940. p. 297-313, illus., tables.) 19 refs. Text in Russian. Title tr.: Formation of ice in the atmosphere.

Conditions for vapor formation, saturation and crystallization in the atmosphere are described. Non-stability of water vapor, pressure in the upper atmosphere at various temperatures and altitudes causes super-saturation or ice formation. The experiments on artificial production of fog at a temperature of  $-35^{\circ}$  C. by Thompson are described in connection with ice crystallization and determination of sizes of water drops. Sea salt particles stimulate condensation and serve as the centers for ice formation. Formation and development of snow flakes or ice crystals are described.

Text in Russian. *Title tr.:* Relation between stress and deformation of frozen ground with consideration of time factor.

The deformation of frozen ground was studied under shearing force of a frozen wooden bar and under compression force of a hard stamp applied to samples of various compositions for periods from several minutes to ten days, also for periods of over a year. Data obtained on the effects of shearing stress are graphed and discussed. The viscous properties of frozen ground (creep factors) are responsible for the persistent deformation, the duration of which varied in the tests with the composition of the samples. Formulas are given to express the interrelations determined between applied stress, time, and type of deformation, as well as variations in the moduli of shearing and residual deformation as a function of stress and duration. A final series of experiments included studies on deformation under intermittent stress and continuous stress increasing with time.-From SIPRE.

The zoogeography of Greenland. (International Congress of Zoology. 14th, Copenhagen, 1953. Proceedings, pub. 1956, p. 126–27)

Discussion of the origin and distribution of land fauna of Greenland, as survivals of a richer circumpolar fauna existing before the glacial period. Survival was possible because of modifications in climate due to Greenland's island location.

Copy seen: DLC.

48738. VIBE, CHRISTIAN, 1913—. Grønlands zoogeografiske problemer. (Grønland, 1953, hefte 11, p. 432–36, illus.) Text in Danish. *Title tr.:* Greenland's zoogeographical problems.

The Greenland fauna constitutes the remains of an ancient fauna, circumpolar in distribution before the ice age but later limited to isolated localities in boreal and arctic areas. Arctic mammals in North Greenland (musk ox, caribou, polar hare, lemming, polar wolf, arctic fox and ermine) may have survived the ice age in The insects are re-Greenland itself. mains of an arctic Tertiary fauna, mostly Diptera, butterflies and ichneumon flies. The subarctic mammals in southern Greenland are probably immigrants via Baffin Island or ice age relicts in ice-free The insect fauna in southern Greenland constitutes the remains of a boreal fauna which in Europe, Asia and North America became extinct during the ice age or was supplanted by new species which immigrated from the south.

48752. VILBORG, L. The uplift of stones by frost. (Geografiska annaler, 1955. årg. 37, häfte 3-4, p. 164-69, illus., text map, diagrs., graphs.) 6 refs.

Contains results of observations in northern Sweden between Mt. Kebnekaise and Kiruna (approx. 67°51′ -53′ N.  $18^{\circ}33' - 20^{\circ}13'$  E.) in summer 1952, A layer of gravel and sand with coarser grains than the surrounding soil was found beneath frost-lifted stones. Grain sizes were analyzed. During freeze or thaw processes, author suggests, a stone stuck to the uppermost layer of soil and lifted by upward expansion of the layer, would leave a cavity; the latter would not cave in immediately, due to soil cohesion with moisture present during freeze or thaw. Coarser particles in the cavity walls being less cohesive than the fine material, fall out and collect in the bottom of the cavity. The stone is thus prevented from slipping back into position during melting. Copy seen: DLC.

Describes survey and prospecting of zirconium formations. Large deposits of minerals of low zirconium concentration are developed to augment the limited sources rich in this element. Distribution of minerals containing zirconium oxides is given with location, specific data on concentration, and estimated production. Abstract of discussion is added, covering also related papers of E. A. Sal'e, q. v., and others.

48780. VOGEL, GÜNTHER, and others. Zur Wirkung von Stoffwechselinhibitoren auf die fortgeleitete Erregung isolierter Kaltblüternerven in verschiedenen Temperaturbereichen. (Pflüger's Archiv für die gesamte Physiologie, 1956. Bd. 263, Heft 5, p. 542–52, illus. table) 30 refs. Text in German. Other authors: W. Westphal, and H. Krause. Title tr.: On the effect of metabolic inhibitors upon stimulus conduction in isolated poikilothermic nerves at various temperatures.

A study of isolated sciatic nerves of the frog, treated with 2.4 dinitrophenol, with sodiumfluoride or untreated, at temperatures of 1° to 31° C. Speed of conduction, characteristics of action potential, refractory time and other parameters were studied. Among them only refractory time showed a pronounced temperature dependence: at low temperature it was longer than the duration of the monophasic action potential. Metabolism inhibitors extended the refractory period.

Contains discussion of the morphology of the isoclinal foldings as presented in various textbooks. Geometry of the isoclinal structures in the Polar Urals is explained by the author on the basis of observed characteristics with a set of

diagramatic illus. The power creating sharp isoclinal bendings of layers can be characterized by the amplitude of the folding. Complicated foldings are classified as monoclinal, anticlinal, synclinal, with and without ruptures, creating isoclinal structure of a high order. Mechanics of the isoclinal structures are explained with consideration of intensity of sliding and magnitude of the amplitude of folding. Sliding of the layers represents the basic form of motion during formation of the isoclinal folding. The complexity of this type of structure is discussed further in detail.

48786. VOĬTKOVSKIĬ, K. F. Ob ispol'zovanii "privedennogo koėffitšienta teploemkosti" pri raschetakh glubiny promerzaniā i ottaivaniā gruntov. (Akademiā nauk SSSR. Institut merzlotovedeniā. Materialy k osnovam ucheniā o merzlykh zonakh zemnol kory, 1955. vyp. 2, p. 65–74, tables, graph.) 3 refs. Text in Russian. Title tr.: Using a corrected coefficient of specific heat for calculating depths of ground freezing and thawing.

Calculation of the approximate depth of soil freezing or thawing is mathematically analyzed with emphasis on Machinskii's method, first presented in 1949. This method ignores phase transition of water in soil and treats ground freezing and thawing as thermal processes. A probable error of up to 37 percent was found with a max, for small differences between surface and ground temperatures. The method of corrected specific heat may be considered satisfactory for quick and approximate solutions ( $\pm 10$  percent) of general engineering problems, and for specific cases with large temperature difference between surface and zero temperature line.—From SIPRE.

calcium oxide from apatite.

New combined Palmer and Erling Johnson method is described for electrolytic extraction of lime, in which nitric acid, easily available in the U.S.S.R. is substituted for chloric acid. This method is based on crystallization of calcium salt from concentrated nitric acid. Calcium nitrate, containing about 80 percent of lime from apatite, is subjected to electrolysis. Lime is deposited on the cathode and nitric acid on the anode. Further processes and their costs are outlined. Prof. Fersman's comments (p. 89) indicate that the method required further development in the laboratory before introduction into industry.

48805. VOROB'EVA, OL'GA ANISI-MOVNA. Khibinskafa gornafa stantsifa

Akademii Nauk SSSR. (In: Khibinskie apatity, 1933. t. 6, p. 268-70). Text in Russian. Title tr.: The Khibiny mining station of the Academy of Sciences U. S. S. R.

Research problems and work are described, including: the study of lovchorrite and its byproducts, analysis of minerals for rare earth content, development of methods for determining molybdenum (Mo) in ore. Expansion of research is discussed in relation to climatology, hydrometeorology. An experimental garden for vegetables, berries, grasses, etc., is added to the existing Polar Botanical Garden. A museum with representative petrographic, mineralogical and botanical exhibits is outlined. Copy seen: DGS.

48806. VOROB'EVA, OL'GA ANISI-MOVNA. Petrografo - khimicheskafa s"emka nugo-vostochnol chasti Lovozerskikh tundr. (In: Khibinskie apatity, 1933. t. 6, p. 210-13, table.) Text in Title tr.: A petrographic and Russian. chemical survey of the southwestern part

of the Lovozerskaya tundras.

Detailed petrographic and mineralogic data, plotted on the topographic map, are discussed in relation to nepheline syenite. This syenite is characterized by a paralleltrachitoid structure, and is called by W. Ramsay "luyavrite." Mineral structure of luyavrite is multiform and its components are given; one, eudialyte, contains an average of about 10 percent zirconium. Copy seen: DGS.

48807. VOROB'EVA, OL'GA ANISI-MOVNA. Poezdki A. E. Fersmana na Kol'skiĭ poluostrov, otdel'nye ėpizody. (Moskovskoe obshchestvo ispytateleľ prirody. Bûlleten', 1946. god 117, otdel geol., t. 21, no. 1, p. 116-20.) Text in Russian. Summary in French. *Title tr.:* A. E. Fersman's expeditions to the Kola Peninsula, separate episodes.

Contains brief description of A. E. Fersman's scientific activities in the Khibiny and Lovozerskaya tundra region during 1929-31. Detailed study was made of mineral-forming processes in alkaline rocks of the Khibiny and classification of basic genetic types. The geochemical types were arranged in chronological order in respect to thermal phases and content of zirconium, titanium, chlorine, fluorine, phosphorous, iron, etc. Rare and colorful mineral specimens were collected such as eudialite, lamprophyllite, astrophyllite, lovchorrite, rinkolite, etc. Fersman's analysis showed a geochemical relationship of the tundras with alkaline massives of Greenland and Arkansas. The first sulfide ores were found in the Monche tundras with minerals pyrrhotite, chalcopyrite, pentlandite. Fersman also found copper-nickel ores and predicted a large deposit, which was confirmed in 1937.

48818. VOSKRESENSKIĬ, KONSTANTIN PETROVICH. Gidrologicheskie raschety pri proektirovanii sooruzheniī na malykh rekakh, ruch'ākh i vremennykh vodotokakh; metodicheskie osnovy i praktika. Leningrad, Gidrometeorologicheskoe izd-vo, 1956. 461 p. tables, graphs, maps (incl. fold.). 73 refs. Text in Russian. Title tr.: Hydrological computations for designing installations on small rivers, brooks and temporary water run-off; methodical bases and practice.

Characteristics of small streams by analogy with those known of large rivers are applied in this hydraulic engineering study under zonal and climatic conditions in the U.S.S.R. As the construction and use of installations is conditioned by specific physical geographic factors, this study is arranged in relation to these factors: water flow in tundra, marshland, forest, cave, lake, etc. Large and small rivers, brooks, etc., are defined on the basis of length, area of run-off, average water flow, depth of stream, etc. Of some 150,000 rivers in the U.S.S.R., 84 percent are small (25 km.2), hence interest in their study. Their hydrology affects agricultural requirements, irrigation and hydro-electric plants, as well as construction of bridges, canals, etc., and protection of railroads and highways. The importance of temporary and seasonal run-off for water reservoirs, ponds, etc. (especially in western Siberia) is con-

Minimum and annual average water flow and run-off are computed with interpolation of physical-geographic factors of the run-off and consideration of the analogy of small with large rivers. The resulting data are plotted with isolines on maps (opp. p. 54). The effect of ice formation in rivers, in tundra and permafrost regions is discussed (p. 297, 305) in relation to reduction of river flow. Theoretical surface evaporation losses (cm./month) are formulated with semiempirical equations in relation to geographic zones and average wind velocities. Isolines for surface evaporation (without ice cover) are plotted on maps (p. 350). Regional arrangement of the evaporation coefficient is shown (map, table, p. 355, 357). Average turbidity and chemical characteristics of rivers are indicated on maps (p. 392, 420). Appendices (5) offer tables with various coefficients and geographic coordination of approx. 200 major centers. Copy seen: DLC.

Revision of terminology related to permafrost and phenomena associated with frost action in soil is discussed, and new principles of a genetic classification are given. In analysis of cryogenetic relief forms, the following processes are discussed: cryogenetic erosion, sorting of materials in freezing and thawing processes, solifluction, frost fissuring, etc., thermokarst, swelling and other phenomena. Meaning of "merzlota" (congelation) is discussed, correlation of other specific factors in cryogenetic relief (chart). Classification of polygonal relief forms is described and tabulated.

tr.: A brief key to fleas of epidemiological importance.

Contains a systematic index to the super-family Pulicoidea, and in the introductory part (p. 9-34), a morphological sketch, data on the biology and epidemiological importance of fleas as carriers of microbes of the most dangerous epidemics; techniques of gathering and microscopic preparations are described. In the special part, are the keys to five families, twelve sub-families, 20 genera and 82 species, with data on hosts (chiefly small mammals, rodents and birds) and importance as vectors of diseases. Species occurring in northern regions of U. S. S. R. are included. Indices of the names of fleas and their hosts are appended. Copy seen: DLC.

48828. VYSOTSKIĬ, KONSTANTIN PETROVICH, and others. Transport torfa. Moskva, Gos. ėnergeticheskoe izd-vo, 1955. 256 p. illus., diagrs., graph, 22 refs. Text in Russian. Other authors: V. S. Larionov and P. P. Samoslov Title tr.: Peat transport.

Construction and maintenance of main railroads and auxiliary field connections for the peat storage depots are presented in detail. Construction of bridges, embankments, excavations, fillings and causeways over marshland and soft ground, reinforcements of river banks, etc., are described, with illus. (p. 14-29). Winter maintenance of roads with snow removers is outlined (p. 57-58). Methods and mechanized equipment for loading peat in the field are described, and operations graphically represented (p. 112-223). Special attention is given to preparation for loading and transportation of peat under winter conditions. Removal of snow, ice and frozen peat surface by excavators and cranes prior to actual loading is shown. Loading of frozen peat requires more power and time (p. 187-89). Copy seen: DLC.

48829. WACHTMEISTER, ARVID. Naming and reincarnation among the Eskimos. (Ethnos, 1956. v. 21, no. 1–2, p. 130–42.) 30 refs.

Describes the custom of naming a newborn child after a recently deceased person, usually a relative, with the idea of transferring to the child the qualities of the deceased. Child-naming customs of various Eskimo groups: the West- and East-Greenland, Polar, Baffin, Labrador, Caribou, Iglulik, Netsilik, Copper, Mac-

kenzie, Alaskan (Yukon River), and Chugach, are considered in turn. The problems of reincarnation, name taboo, mild treatment of children due to fear of offending an ancestral soul, etc., are discussed. Only among the Copper Eskimos this naming custom exists without notions of reincarnation and name-taboo.

The annual mean precipitation for all Swedish stations for the period 1911–1920 is tabulated. Selected data are utilized to compute the precipitation on a country-wide basis for the period 1881–1920. Monthly values for some 60 Swedish stations (several in the far North) are tabulated in parts per thousand of the total annual value. These values are also mapped.

48846. WALLER, ROGER M. Ground-water supplies in the Juneau area, Alaska. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1809.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. Water-bearing sands or gravels are found overlying, within, or beneath the glacial till which is the predominant surficial material on both sides of Gastineau Channel. Near mouths of larger streams that disgorge from the mountains, sand and gravel deposits contain potable water. Bedrock, where extensively fractured, supplies a limited amount.

Copy seen: DGS.

48847. WALLERSTEIN, GEORGE. Navigation on the Greenland ice sheet. (Navigation, Dec. 1956. v. 5, no. 4, p. 181-82.) 3 refs.

Methods of navigation employed by SIPRE's Project Jello during the summer of 1955 are described. The group of six men traveled in four weasels 1200 miles from Thule to the French Central Station, then WSW to a point near the marginal crevassed zone. Steering was accomplished by the navigation weasel, which carried a sun compass, a gyro, and a magnesyn compass. A reading with the sun compass was obtained every five miles and the gyro set accordingly. A run of 25 miles was made every second day and the system worked so well that a maximum deviation of one mile was measured from the dead reckoning position at the end of each run.

Copy seen: DLC.

48848. WALLERSTEIN, GEORGE. Refraction observations on the Greenland icecap. (Navigation, Sept. 1956. v. 5, no. 3, p. 138-40, tables.) 6 refs.

Contains results of observations of sun refraction at low altitudes made during the summer of 1955 along a route from Thule eastward then south to the Central Station of Expéditions polaires françaises at 70°55' N. 40°38' W. The trip was part of expedition Jello of the U.S. Army Corps of Engineers' Snow Ice Permafrost Research Establishment. Observations were taken with a Wild T-2 theodolite under all conditions with a visible sun and always over a snow surface. results show that for ship or aircraft navigation, solar observations may be used down to about one degree, with errors no more than one minute. A slightly greater error may be introduced for measurements between one degree Tables of raw data and and the horizon. mean refraction are included.

48856. WALTER, C. Hydracarinen der nordschwedischen Hochgebirge, erster und zweiter Teil. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 4, Zoologie, Lfg. 5, pub. 1914. p. 587–638, 3 illus., plates 8–9.) Text in German. Title tr.: Hydracarina of the northern Swedish high mountains, first and second parts.

Describes 28 water mites (six new), mostly from the Sarek Mountains, but some from other localities of Swedish Lapland; the distribution in Europe is given. In pt. 2, notes and distributional data are offered on 16 mites, of which four (one new), should be added to those described in the first part. The distribution of the 32 species in Swedish Lapland is discussed (cf. tables p. 624, 629), and notes added on the biology and ecology. Copy seen: MH-Z.

48857. WALTERS, VLADIMIR. The ribbed sculpin, Triglops nybelini, Spitsbergen waters. (Copeia, May 20,

1955, no. 2, p. 145-46.)

Study of a small collection (nine specimens) of this fish obtained by H. K.-M. Lund in Forlandsundet. Sept. 10, 1953, depth 200 m., bottom temperature 2° C. It is compared with the closely related T. pingeti. Previous records of T. nybelini are from Greenland waters, Labrador and Ungava Bay. Copy seen: DLC.

48858. WARD, IRA J., and others. Mechanical stabilization of a gravelly sand from the beach at Point Barrow, Alaska. Ames, Iowa, July 1, 1955. iv, 58 l., illus., diagrs., tables, maps. (Iowa State College Engineering Experiment Station, Progress report, Project 320-S, contract Nonr-530 (04) Geography Branch. Office of Naval Research) 22 refs. Other authors: R. L. Handy, D. T.

Davidson, and C. J. Rov.

Several samples of beach material were collected from the vicinity of Pt. Barrow to determine if the beach might be stabilized by additions of locally available binder materials. Samples of tun-dra were tried as binder materials. Plasticity and gradation properties were measured in each of the various samples, and mixes were proportioned to meet standard granular stabilization specifications. Samples of the various mixtures were then compacted to simulate field compaction with rollers, and the compacted specimens were tested to determine the effectiveness of the treatment. The best mixture obtained has a California bearing ratio of 31 after soaking in water for 72 hrs. The value of 31 indicates that the stability is probably not adequate for permanent base or surface course construction. The low stability appears to be due to the highly rounded nature of the beach aggregate.

48860. WARDLE, J. M. A major power plan for Yukon River waters in the Canadian Northwest. (Institution of Civil Engineers. Proceedings, July 1957. v. 7, p. 441-64, diagr., maps.) paper no. 6213. Summary in Roads and construction, July 1957, v. 95, no. 7, p. 130-31.

An overall plan is outlined for a power project, including power plants and industrial sites, for an area approx. 58°30'-59°10′ N. 133°-134° W. between Lake Atlin and Taku Inlet. The power plan has a potential of nearly 5 million hp. The effects of climate, seismic disturbances, and glacial areas are discussed briefly. The project is adaptable to construction by stages (four); if developed, it would have a stimulating effect on Canadian resource development. The undertaking is recommended in spite of possible competition from nuclear power plants. This plan is based on four years' survey by Ventures - Frobisher - Quebec Metallurgical Industries Ltd.

Significant deviations of stratospheric temperatures from expected mean values were found from radiosonde observations over Alert, Ellesmere Island, during the winters of 1951-1954. Upper-air charts for stratospheric levels up to 20 km. were used to investigate extreme temperature and pressure conditions in the arctic stratosphere up to the 100- and 50-mb levels. Some of the periods of extremely high stratospheric temperatures Alert were explained by effects of the tropospheric and stratospheric circulation over the entire Northern Hemisphere on the high levels over the Arctic. Special studies were made of the motions of the hemispheric circulation centers, represented by the two high-reaching atmospheric centers of cold air over northeastern Siberia and the Canadian Arctic Islands, and their effects on stratospheric temperature changes. The sudden heating of the arctic stratosphere and the associated anticyclogenesis over northwestern Canada during the first half of Feb. 1952 (Thule phenomenon) could not be definitely explained, but an advective connection with the unusually warm stratosphere over Germany, during the last days of Jan. 1952 is probable. 100-mb. temperatures over Alert did not show any connection with geomagnetic disturbances from Nov. 1951-March 1952. 48862. WARREN, HARRY VERNEY, 1904—, and R. E. DELAVAULT. Biogeochemical prospecting in northern latitudes. (Royal Society of Canada. Transactions, 1955. Third ser., v. 49, sec. 4, p. 111–15, graphs, 3 tables.)

Many geochemical techniques are impractical in northern areas: water testing is not feasible during part of the year; soil sampling is difficult and unreliable in many places due to frozen ground and lack of residual soil. Preliminary results are presented from sampling and analyzing some relatively well known botanical species near and away from known mineralization. Birch (Betula papyrifera and B. glandulosa), Labrador tea (Ledum groenlandicum), spruce (Picea mariana and P. glauca), and willow (Salix sp.),

collected in Northwest Territories, Yukon, and Northern Quebec, were found capable of reporting anomalously high zine and copper contents in underlying rocks. *Copy seen:* DGS.

48863. WASHBURN, ALBERT LINCOLN, 1911— . Classification of patterned ground and review of suggested origins. (Geological Society of America. Bulletin, July 1956. v. 67, no. 7, p. 823—65, illus. on 7 plates, diagrs.) 197 refs.

"Patterned ground is a group term for the more or less symmetrical forms . . . that are characteristic of, but not necessarily confined to, mantle subject to intensive frost action." Patterned ground is broadly classified, in order of increasing gradient, into sorted and non-sorted varieties of circles, nets, polygons, steps, Each of these is defined, and stripes. described, and illustrated, with notes on occurrence. Origin of patterned ground has not been satisfactorily explained. Hypotheses based on the following dominant processes are reviewed and evaluated: expansion due to freezing; expansion due to absorption of water by colloids; weathering; contraction; convection; moisture-controlled changes in intergranular pressure; differential thawing and eluviation; vibration; artesian flow; rillwork (for stripes); solifluction in combination with one or more of the above processes (for stripes). The discussion supports the conclusion of the polygenetic origin of patterned ground. The descriptive classification adopted here eliminates ambiguities and confusion resulting from overlapping and synonymous terms in the literature. More information is needed before these forms can be fully understood.

Copy seen: DGS.

48864. WASHBURN, ALBERT LINCOLN, 1911- . Unusual patterned ground in Greenland. (Geological Society of America. Bulletin, June 1956. v. 67, no. 6, p. 807–810, 4 illus. on 2 plates) 17 refs.

Contains description of small well-developed sorted nets occurring on an ice-cored moraine of the Greenland ice-cap about 16 km. southeast of Thule, northwest Greenland (76°34′ N. 68°48′ W.). Author suggests that nets may be result of differential thawing and eluviation combined with upfreezing of stones and local differential heaving. Further study is recommended.

48870. WATERHOUSE, ROBERT W. Structures for snow investigations on the Greenland ice cap. Wilmette, Ill., Apr. 1955. 38 p. illus., diagrs., tables. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establish-

ment. SIPRE Report 27.)

Lightweight portable structures have been installed in excavations in snow for the purpose of procuring, over a long period of time, stress-and-strain behavior data of massive snow such as exists over an extensive area of Greenland. shoring-type structures and columntype structures will develop pressures from snow accumulation to be measured periodically with electrical strain-gagetype pressure cells. Supplementary structures exhibiting visible responses to snow accumulation and consolidation with time, including lightweight metal arches and a shelter composed of snowblock walls with a prefabricated metal roof structure, were also installed and observed. Initial observations include description of the excavation procedure and, briefly, load characteristics.

Contains a description of the experimental arrangement used for measuring the direct effect of light on amphibian irides, followed by studies of sensitivity and reflectivity, migration of the pigment granules in the retinal epithelium, and

measurements with white light and sunlight. Copy seen: DNLM.

**4882.** *WEATHER.* Arctic sea-smoke. (Weather, Oct. 1956. v. 11, no. 10, p. 318, illus.)

Contains photograph and explanation of arctic sea-smoke or frost-smoke. This phenomenon depends on the overlying air being so cold, compared with the water surface, that evaporation occurs rapidly enough to saturate the air nearest the sea surface, before this air can be mixed by turbulence with drier air at a slightly higher level. It is believed that arctic sea-smoke does not form until the air is at least about 16° F. colder than the sea. The phenomenon is common in the polar regions in the early autumn.

4885. WEDOW, HELMUTH, 1917—Adaptation of portable survey meters for airborne reconnaissance with light planes in Alaska. Washington, D. C., Oct. 1951. 11 p. Mimeographed. (U. S. Geological Survey. Trace elements memorandum report 323.)

Meters adapted for airborne radiation reconnaissance were used in Alaska during summer 1951 incidentally to flying for other purposes. The meter was modified by attaching a large probe consisting of six 2- by 40-inch gamma tubes connected in parallel; its resultant weight was 25 Though not tested on highpounds. grade uranium deposits, the instrument distinguished small areas of granitic rocks containing 0.003 to 0.004 percent equivalent uranium from rocks of normal radioactivity, at distances of 25-500 ft. and at flying speeds of 40-100 mph. No radioactivity anomalies were detected; but sufficient data were accumulated to warrant airborne reconnaissance to supplement ground investigations.—From Author's abstract. Copy seen: DGS.

Geologische Gesichtspunkte zur Frage der Eiszeitüberdauerung von Pflanzen in Grönland. (Naturforschende Gesellschaft, Schaffhausen. Mitteilungen, 1941. Bd. 17, p. 97–115.) 18 refs. Text in German. Title tr.: Geological aspects of the problem of ice-age survival of plants in Greenland.

The problem of possible ice-free areas during the Pleistocene, is discussed, with consideration of crustal movements and their relation to glacial advances and retreats, and of the vegetation of Greenland during the Mesozoic and Tertiary periods. The botanist's viewpoint is introduced, and further study by plant geographers and ecologists, is suggested, also geophysical investigations to determine recent movements of the land.

Summarizes results of laboratory beneficiation tests on iron ores from Klukwan (59°24′ N. 135°54′ W.) near Haines, Southeast Alaska. Iron is present as a fine-grained magnetite associated with a pyroxenite-type basic rock. Average magnetic iron content of the magnetite lenses is about 45–50 percent. Physical and chemical characteristics of six samples are described; also methods of concentration. Magnetic separation procedures produced concentrates assaying more than 60 percent Fe and two to four percent TiO<sub>2</sub>.

of clay in Sweden. Above the highest glacial marine limit, clay is found only occasionally in Sweden. If it is varved, it was deposited in glacial lakes, if unvarved, in other lakes. Relation between the glacial marine limit and the extent of clay is shown (map). Along the coasts, glacial clay is of greatest importance except where large streams enter, as along the Norrland coast. Variations in thickness of the clay, generally not great in the North, result in part from the length of time of deposition. Disturbed and undisturbed clays differ in strength; they can be distinguished and the strength related to salt content of water bodies in which they were laid down. Marine, glacial lake and other lake clays were investigated. In Norrland waters, salt content has been low, clay has less tendency to slide than elsewhere in Sweden. Clay from water of greater salt content is more prone to landslides, an important factor in construction. Copy seen: DGS.

48898. WENNER, CARL GÖSTA. Investigation into the possibilities of distinguishing the pollen of various species of *Betula* in fossil material. (Geologiska föreningen, Stockholm. Förhandlingar, 1953. bd. 75, häfte 3, no. 474, p. 367–80, 8 diagrs., table.) 7 refs.

Size measurements of pollen grains are questioned as a basis for geologic results. Alterations in size may result from accidental factors in measurements, differences in fossilization, or in the soils containing the pollen. It is suggested that pollen from more than one kind of tree be studied together for comparison. Such a study is described and the mathematical results are presented in detail. Materials studied include pollen from Kalixfors near Kiruna, northern Sweden.

Swedish. *Title tr.:* Viewpoints on the supply of gravel for Swedish railway ballast and a proposal for a new ballast

Rationalization of supply should provide better gravel for Swedish railways at lower cost. Good gravel is generally found as layers in less useful deposits. Sorting is necessary to avoid associated sand and clay materials. Size of material, nature of parent rock, and resistance to weathering are discussed. A natural gravel and crushed rock mixture is suggested for ballast. Locations of gravel pits in operation in 1948 and those suggested for use in the long range program (cf. maps) include some sites above the Arctic Circle.

H

V

48907. WESTERN CONSTRUCTION. Alaska's frost and food problems. (Western construction, Feb. 1956. v. 31, no. 2, p. 24-26, illus.)

Contains description of special construction techniques used at Bethel, including maintenance, supply, and personnel problems. Timber piles 30 ft. high with refrigeration piping are installed in 18-in. holes drilled into permafrost; sandy-silt slurry is pumped around the piles as backfill and is artificially frozen. Control boards will be connected to thermocouples to regulate the freezing process and to maintain a check on foundation conditions. The drilling tool is a special auger equipped with an "Alaskaug" drilling head, consisting of four cutting surfaces with square carbide The head can be shifted into inserts. an upside-down position to provide more cutting surfaces. Copy seen: DLC.

48908. WESTERN CONSTRUCTION. Alaska's skyscraper. (Western construction, Sept. 1956. v. 31, no. 9, p. 28-29, illus.)

Construction of a 14-story apartment building at the port of Whittier during 1954-1956, is described, particularly steel and concrete work. The locality (60°45' N. 148°45' W.), 62 mi. southeast of Anchorage, has 108 in. rainfall and 208 in. snow yearly, also winds of more than 100 mph. Work in severe weather was facilitated by a specially designed false roof which was raised on steel trusses designed and fabricated to span over the entire structure as it built upwards. A drop canvas skirt was hung around the perimeter of the temporary roof. building was completed under a \$4,029,-620 contract with the United States Army Corps of Engineers. A sevenstory structure with 538 rooms, completed in 1953 at Whittier is also noted. The two buildings provide quarters, recreational facilities, etc., for military personnel. Copy seen: DLC.

48909. WESTERN CONSTRUCTION. Alcango pipeline, part 2 of 2; constructing 620 miles of trouble. (Western con-

struction, Mar. 1955. v. 30, no. 3, p. 29+, illus.) Sequel to No. 43282 of Arctic Bibliography.

Organization and equipment of this operation to build an 8-in. oil line from Haines to Fairbanks are described. The work, by Williams Bros., of Tulsa, Okla, was initiated in Dec. 1953. A trenching machine was modified to work in the permafrost but bucket point had to be replaced after each shift. Radiographic inspection disclosed many failures in the welding. The pipeline was completed Nov. 15, 1954, except for one crossing.

48910. WESTERN CONSTRUCTION. What's the Alaska road situation? (Western construction, Mar. 1955. v. 30, no. 3, p. 57-58, 60, map.)

Major problems faced by the Alaska Road Commission in the construction and maintenance of Alaskan highways are discussed. Excavation in frozen ground, protection of bridges from ice, and road surfacing problems are included. The location of paved, gravelled, and planned highways in Alaska is mapped; construction to date has been confined to the Pacific mountain and central plateau regions.

Copy seen: DLC.

48911. WESTERN MINER. All-weather dredging operation. (Western miner, Mar. 1956. v. 29 no. 3, p. 40, 4 illus.)

Dredge is reclaiming mill tailings dumped into Great Bear Lake prior to 1952 at Port Radium for Eldorado Mining and Refining Ltd. In winter, area around dredge is kept ice-free by an encircling pipe system, from which warm water (mine discharge, acid plant cooling water, leach plant overflow) is discharged under pressure through 43 jets. Dredge maintains steady rate of operation throughout the coldest weather.

Copy seen: DGS.

48912. WESTERN MINER. Development in Yukon and the Northwest Territories. (Western miner, Apr. 1956. v. 29, no. 4, p. 52-56, table.)

Contains report with statistics on gold, silver, pitchblende, crude petroleum, natural gas, tantalum, columbium, lead, zinc, coal, and cadmium production for 1955 compared with 1954; also development work at gold mines near Yellow-knife, exploration for uranium, lithium, copper, iron, nickel, lead-zinc, asbestos. In Northwest Territories, 8,890 mineral claims were staked during 1955, primarily in the Marian River uranium area and between Great Slave Lake and the Saskatchewan border; in Yukon, 3,038 claims, particularly on copper showings

in the Upper Liard River area and asbestos discovery north of Dawson.

Copy seen: DGS.

**48913.** WESTERN MINER. Mackeno resumes milling. (Western miner, Aug. 1956. v. 29, no. 8, p. 64-66, illus.)

Milling at Mackeno Mines Ltd. silver-lead-zinc operation, Mayo region, Yukon, was resumed July 3, 1956, at rate of 125 tons a day. Ore reserves, approx. 90 percent of which are ready for mining or milling, total 37,774 tons, averaging an estimated 41.2 oz. silver per ton, 9.2 percent lead and 11.7 percent zinc. Plans call for at least one year's milling. Surface exploration is also planned.

Copy seen: DGS.

48914. WESTERN MINER. New arctic survey ship. (Western miner, Sept. 1956. v. 29, no. 9, p. 45, illus.)

Contains description of the Baffin, flagship of the Canadian Hydrographic Service, launched June 18, 1956. Vessel has over-all length of 285 ft., displacement 3,700 tons, a hull strengthened for heavy ice, and a cruising range of 14,000 miles without refueling. Complement of 102, includes 12 hydrographers and five other scientists. Survey equipment and laboratories are briefly described. Vessel is equipped with hangar and landing deck for two helicopters. Copy seen: DGS.

**48915. WESTERN MINER.** New base metal find for B. C. (Western miner, Mar. 1956. v. 29, no. 3, p. 74, 76.)

Includes brief description of exploration by Tarbell Mines Ltd. in Mackenzie District. Geologic mapping in the Marian River uranium area (63°04′ N. 116°19′ W.) outlined two radioactive zones, one producing some high grade assays. Notes on structure are given. Diamond drilling was started on a gold showing about eight mi. north of Yellow-knife, Great Slave Lake. Exploration at company's gold property in the Snare River area (64°00′–10′ N. 115°19′–27′ W.) outlined 50,840 tons of ore. No development has taken place.

Copy seen: DGS.

48916. WESTERN MINER. A photo visit to United Keno Hill Mines. (Western miner, May 1956. v. 29, no. 5, p. 40-41, 7 illus., 2 ports.)

Winter photographs from Elsa and Calumet, Yukon Territory (63°55′ N. 135°29′ W.): mine buildings and homes, mill interior, one of the heavy paper

fences with slab lumber supports erected along the roads to combat icings.

Copy seen: DGS.

48917. WESTERN MINER. United Keno Hill profits exceed \$1½ million. (Western miner, Jan. 1956, v. 29, no. 1, p. 61.)

During fiscal year Oct. 1, 1954–Sept. 30, 1955, United Keno Hill Mines Ltd. of Yukon Territory produced 18,554 tons lead concentrate and 19,775 tons zinc concentrate containing 5,670,137 oz. silver, 26,350,198 lb. lead, 24,035,999 lb. zinc, 302,297 lb. cadmium. Costs and returns are itemized. Ore reserves at the various mines are estimated and some development work is noted. Total holdings in the Keno Hill-Galena Hill area (63°53′-55′ N. 135°02′-27′ W.) are 459 mineral and 2 placer claims. Exploration and development of the Hector, Calumet, and Elsa mines on Galena Hill and exploration on Keno Hill will continue.

Copy seen: DGS.

48918. WESTERN MINER. A visit to Beaverlodge and to Giant Yellowknife. (Western miner, Feb. 1956. v. 29, no. 2, p. 34–35, 10 illus., 4 ports.)

Photographs of townsites and mine buildings in the Beaverlodge Lake uranium mining area, northern Sask., and of the Giant Yellowknife Mine, Great Slave Lake. **Copy seen:** DGS.

48919. WESTERN MINER. Yukon Consolidated. (Western miner, May 1956. v. 29, no. 5, p. 84.)

During 1955, Yukon Consolidated Gold Corp. Ltd. dredged 5,319,022 cu. yds. of gravel to produce gold valued at \$1,524,058. Seven dredges operated throughout the period. Stripped reserves as of Dec. 31, 1955 are 13,344,617 cu. yds., providing an average of 6½ seasons for six dredges. Proved gravel reserves in addition to the above were estimated at 43,633,125 cu. yds., with values of \$18,072,291.

WESTFALL, BERTIS ALFRED, 1907—, see Meyer, D. K., and others. Water and electrolyte . . . anoxia, cold and inanition. 1956. No. 46734.

**48920. WESTFALL, HERBERT C.** Research and design of a single main recirculating system. (*In:* Alaskan Science Conference . . . 1953. Proceedings, *pub.* 1956, p. 48–53.)

The economics and construction principles of the four types of water systems

considered for Fairbanks are described briefly, and steps taken in designing the single main recirculating system adopted are described in detail. The system provides sufficient flow velocities to return the water to the source of heat before sufficient heat is lost to cause freezing. This type of system is believed capable of providing an adequate, trouble-free water supply to arctic communities.

48921. WESTIN, B., and others. Na<sup>24</sup> clearance in hypo- and hyperthermic rats. (Acta chirurgica scandinavica, Feb. 1956. v. 110, fasc. 4, p. 316-18, illus.) 5 refs. Other authors: A. Parentela, D. Ziliotto and E. Odeblad.

At lowered body temperature, a depression of clearance of subcutaneously injected radiosodium was observed: at elevated temperatures both high and low clearance were found.

Copy seen: DNLM.

48922. WESTIN, B., and others. On the subcutaneous and intrahepatic clearance of radiobromide in normo- and hypothermic rats. (Acta chirurgica scandinavica, Dec. 1956. v. 112, fasc. 1, p. 28-31, illus.) 9 refs. Other authors: A. Parentela, D. Ziliotto and E. Odeblad.

Hypothermic rats showed considerable depression in clearing both subcutaneous and intrahepatic  $Br^{sg}$  as compared with normothermic animals.  $O_2$  inhalation could not normalize the depression caused by hypothermia.

Copy seen: DNLM.

48923. WESTLUND, C. Use of hot compressed air at Kiruna. (Canadian mining journal, Jan. 1956. v. 77, no. 1,

p. 51-52, illus.)

At Kiruna iron mines in northern Sweden (67°51′ N. 20°13′ E.), open-cut mining is no longer economical, and a gradual change to underground caving methods is in progress. Annual production of 12 million tons of ore is planned. The length of the ore-body and the low winter temperatures which freeze pipelines create technical problems in supply of compressed air to the workings. To overcome these, a decentralized hot compressed air supply system will be provided. Its operation, advantages, and disadvan-

tages are discussed; increased comfort for miners is noted in workings where tools are fed with the hot air.

The occurrence and effects of sunlight and moonlight in the Arctic are discussed. A chart is presented which can be used to determine the direction in which the sun rises or sets on any day at any latitude from 0°-75° N. Other charts to determine the hours of sunlight and twilight are offered. Moonlight and the northern lights contribute significantly to illumination during the winter night. The effect of atmospheric refraction, moon light and hunting, water sky, land sky, sun dogs, and arctic hysteria, light effects on agriculture, etc., are discussed.

48932. WHEELER, JOHN OLIVER. Evolution and history of the Whitehorse trough as illustrated by the geology of the Whitehorse map area, Yukon. vi, 154 p. illus., maps, incl. 1 fold. col. Ph. D. thesis, Columbia University, 1956. Microfilm pub. no. 16,828, University Microfilms, Ann Arbor, Mich.

This trough, which received sediments from late Triassic to early Cretaceous, extended southeast from Carmacks (62°06' N. 136°19' W.), Yukon, into northwest British Columbia. Most of the Whitehorse map area is underlain by Mesozoic rocks deformed into northwesttrending folds. Gently deformed and flat-lying mid-Cretaceous and Tertiary volcanic rocks overlie the folded and faulted Mesozoic rocks with angular unconformity. In late Triassic, the Whitehorse trough lay east of a volcanic arc, probably extending along the axis of the Coast Mountains. In early Jurassic, parts of this arc were spasmodically uplifted and coarse sediments poured into the trough on the side facing the craton. Granitic rocks were brought into contact with the volcanic rocks just prior to or during this uplift. The sediments in the trough may have overlapped the earlier Jurassic sediments along the margins, and probably were derived from quartzand chert-rich source areas farther from the axis of the trough than earlier in the Jurassic. The rate of uplift of source areas and the rate of subsidence of the trough appear to have decreased by early Cretaceous. The trough was then deformed in mid-Cretaceous.-From Dissertation abstracts 1956, v. 16, p. 1243-44. Abstract also pub. in Canadian mining journal, Dec. 1956, v. 77, no. 12, p. 93.

Differences in concentration of dissolved solids and chemical composition in small to medium-sized streams in Alaska are attributed to differences in geology, topography, and precipitation of their drainage basins. These streams show wide variation, and large streams a remarkable uniformity (tables available but not reproduced); analytical data from Southeast Alaska, Copper River Kenai Peninsula, and Yukon River basin are discussed. Rivers in coastal Alaska are dilute and soft; those in the interior contain more dissolved solids. Physical factors contribute to a lower rate of denudation than in areas of more temperate climate.

48938. WHITE, DAVID, 1862–1935. Geological factors affecting and possibly controlling Pleistocene ice sheet development in North America. (Washington Academy of Sciences. Journal, Feb. 4, 1926. v. 16, no. 3, p. 69–72.)

Abstract of discussion on physiographic and continental changes following middle Tertiary and Pliocene times. Movements of the Pleistocene ice sheet in North America were determined mainly by terrestrial factors, such as changes of level of the land, reduction of the epicontinental sea, expansion of the continental surfaces, changes in ocean currents, air currents, rainfall, etc. astronomical phenomena, such as variation in solar radiation, may cause changes in earth climate, in ocean and air currents, but Pleistocene glaciation may be explained by terrestrial, rather than astronomical changes.

48940. WHITE, SIDNEY EDWARD, 1916outlet glaciers, northwest Greenland, 1953. København, C. A. Reitzel, 1956. 31 p. 7 illus., 5 text maps, 2 graphs, 3 tables. (Meddelelser om Grønland. bd. 137, nr. 8.) 15 refs.

In summer 1953, the author and others (under leadership of R. P. Goldthwaite) investigated Nordre and Søndre Tvillinggletscher (approx. 76°55' N. 67° W.), east of Wolstenholme Fjord. Stakes driven into both glaciers in July 1953 were used for measurements of melting and glacier movement in 1953 and in 1954 (by Goldthwaite). Discharge measurements were made on the glaciers and drainage area to the north. Two periods of maximum melting occurred in 1953, one in late June-early July due to solar radiation, the other in late July-early Aug. as result of warm winds and rain. Nordre Tvillinggletscher, which moved an estimated 15.7 m. in 1953 (16.7 m. in 1954) is relatively free of crevasses. Søndre Tvillinggletscher, which moved 32.5 m. in 1953 (30.2 m. in 1954) has numerous crevassed areas. A sequence of moraines indicates overall retreat of the inland ice margin with successive shorter advances during the past thousand years. Studies of glacial deposits, former lake levels, varyes, and botanical evidence determined eight stages of advance and retreat. Seven new, approved geographic names in the region are listed.

48941. WHITE, SIDNEY EDWARD, 1916—. Glaciology of Twin outlet glaciers. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954, p. 73–91, illus.,

diagrs., table.)

"The maximum melting on North Twin Glacier and South Twin Glacier (northwest Greenland) occurred in early July, and again in late July to early Aug. The equivalent of 24.5 in. of water (an estimated average) was lost from these glacier surfaces between July 2 or 4 and Aug. 29. North Twin Glacier moves an estimated 52 ft./yr., whereas South Twin, the larger and wider of the two, moves 107 ft./vr. North Twin Glacier is relatively free of crevasses. South Twin has numerous areas of crevasses 3-20 ft. wide, which reseal by pressure or melt out as the glacier moves on. Examination of glacial deposits in Twin Glacier valley reveals a history of overall retreat with successively shorter glacier advances during the past thousand years. Outlet glaciers are sensitive and subject to marginal fluctuations; so study of their vacillation provides a key to the smaller marginal shifting of adjacent Nuna Ramp. As access routes, such outlet glaciers present numerous obstacles to vehicular traffic in the form of steep termini, minor surface irregularities, 5° ice slopes, surface melt-water run-off in deep stream channels, local heavily crevassed areas, slushy surfaces at certain seasons, and 10° to 15° snow-covered slopes where the glaciers leave the ieccap. Nevertheless they are not impassable if a carefully engineered route is made."—Author's abstract.

48945. WHITTINGHAM, D. G. V., and F. W. BASKERVILLE: Wet-cold trials in Scotland. [London] Air Ministry, Dec. 1954. 1 p.l., 22 p. illus. (R.A.F. Institute of Aviation Medicine, Farnborough, Hants., Flying Personnel Research Committee, FPRC 903.)

Four subjects, simulating a successful parachute drop, tested a survival pack designed for Naval aircraft during two days and nights in Feb. 1954. The tests were conducted in a wet cold environment. Temperatures ranged from 24° F. to slightly above freezing; snow depths in the area ranged from 1 to 5 ft. Additional equipment for testing was dropped by parachute after the first two days. The subjects suffered little more than discomfort. Results indicate that thaw with subsequent wetting and loss of thermal insulation is the most serious problem for survival in a wet cold environment. Recommendations concerning dinghies, clothing, rations, and stoves are given, and evaluations are made of the parachute as used for tents and padding, sleeping bags, air mattresses, poncho cape, immersion suit, vapor barrier boot, and signalling apparatus.

48948. WIK, HARALD. Norra Sveriges sågverksindustri från 1800-talets mitt fram till 1937. Stockholm, AB Kartografiska institutet, 1950. 328 p. diagrs., illus., graphs, maps, tables. (Geographica, nr. 21.) Approx. 180 refs. Text in Swedish. Summary in English. Titte tr.: North Sweden's sawmill industry from the mid-19th century to 1937.

A survey of sawmill development in Norrland, based on real property tax records before 1896 and on source material for industrial statistics 1896-1937. Water-driven sawmills reached their peak in the 1860's, steam sawmills about 1900. The industry declined in the 20th century due to shrinking supplies of raw material and competition of the pulp industry. Increasing use of the circular saw in the 20th century, particularly in northern Norrland, and its effect on localization and distribution of the industry is discussed. Predominance of southern Norrland as a sawmill area has lessened since 1900. Importance of the industry to Norrland, its effects on agriculture and economic conditions are analyzed.

48954. WILDHAGEN, AAGE, 1914- . Dyr i farger; padder, krypdyr, pattedyr. Oslo, Aschehoug, 1956. 113 p., 109 Text in Norwegian. Title tr.: Animals in color; amphibians, reptiles, mammals.

Popular descriptions are given of over a hundred representatives of these forms of animal life as found in Norway, a few elsewhere in Scandinavia; habitat, life cycle, distribution, aids to identification, scientific and common names are included, and most are illustrated in color by Karl Aage Tinggaard. Copy seen: DLC.

48955. WILDHAGEN, AAGE, 1914-Litt om varmereguleringen og våre land-(Naturen, 1952. nr. 3, p. 80-93, maps.) Text in Nor-Title tr.: Brief comment on

blooded land mammals.

pattedyr.

Bergmann's rule, that representatives of warmblooded animal species living in cold climates are larger than those living in warmer localities, and Allen's rule, that animals which live in cold regions have more compact body structure than their relations in warmer lands, are applied to large and small animals found in Norway, of which only the mountain fox is truly an arctic species. Temperature conditions optimum for one population may be unsuited to another of the same type. Local changes in temperature may have direct effects on species' welfare.

temperature regulation and our warm-

It appears that warmth-tolerant species are increasing and arctic types decreasing in Norway. **Copy seen:** DLC.

48956. WILEY, JOSEPH F. Status of insect control in Alaska, military aspects. (In: Alaskan Science Conference...1952. Proceedings, pub. 1954, p. 73.)

Includes information on efficient insect (mosquito) control for military camps and installations; equipment; protection of small, isolated stations; air and ground control measures and their merits, etc.

48957. WILIMOVSKY, NORMAN J. The utilization of fishery resources by the arctic Alaskan Eskimo. Stanford, Calif., Natural History Museum, Stanford University, 1956. 8 p. map (*Its*: Occasional papers, no. 2) 7 refs.

Report of an investigation covering natives of the area from Point Hope in the west to Hershel Island, Yukon Territory. It was largely conducted by the Arctic Research Laboratory, Point Barrow, Alaska, with the aid of the Office of Naval Research. The marine and fresh-water fishes and their utilization by the local Eskimos, fishing methods, seasons and catch, conservation of stock, consumption, storage and preservation discussed. Fishing has been a secondary occupation among these seamammal hunters, and poorly developed. Fishery utilization has declined. It could be developed should need arise.

Title tr.: Some notes on our sea birds and our acquaintance with their occurrence and fluctuation in numbers.

Sea birds of the outer and inner coastal areas of Norway are considered from south to north. Food supply, meteorological and oceanographic changes, predatory animals, nesting and living habits, and infectious diseases are possible regulators of this population. Measures to keep it in optimum condition are discussed.

48963. WILLIAMS, PETER J., and others. Preliminary report of investigations into certain solifluction and patterned ground features in Norway. Cambridge, England, Anglo-Norwegian-American Frozen Ground Research Group, 1956. [114] p. illus., sketch maps, diagrs., graphs, 6 tables. Mimeographed. 29 refs. Summary in Norwegian. Other authors: L. Ore, S. Haslam, and E. Smith.

Results of the Group's investigations mainly in mountain areas of central Norway, during 1953-1955; in 1955 the party of 13 was led by the writer. Factors involved in soil freezing and frost heaving processes are discussed. Solifluction terraces and amorphous solifluction (occurrence and the causes of soil movement) are described, with consideration of the development of stony earth circles. Plant communities on these solifluction and patterned ground features are treated in some detail. Appended is information on instruments and methods used in ground temperature measurement and recording of earth movements.

Account of investigation on the types of Mycobacterium tuberculosis responsible for the high prevalence of bone and joint tuberculosis in Alaska. In 180 cultures isolated from human cases of extrapulmonary tuberculosis, no bovine only human type bacilli were found. Of 5,114 cultures isolated by the Alaska Dept. of Health, all except one were of the human type. All this, and tuberculin tests of cattle indicate that the bovine type

bacillus plays a minor role in the etiology of human tuberculosis in Alaska.

, and others. Economic significance of basement subdivision and structures in Canada. (Canadian mining and metallurgical bulletin, Aug. 1956. v. 49, no. 532, p. 550-58, 2 text maps, 14 tables.) 46 refs. Also pub. as: Canadian Institute of Mining and Metallurgy. Transactions 1956, v. 59, p. 310-318. Other authors: R. D. Russell and R. M. Farquhar.

Contains "results of age determinations made upon Canadian minerals as aids in recognizing and interpreting some of the geological subdivisions of Canadian rocks." Includes among others, ages of pegmatites from Yellowknife (Great Slave Lake), Eldorado Mine (Great Bear Lake), and Stark Lake, all in Mackenzie District, and of lead ores from several mines in Yukon Territory and from Pine Point and Yellowknife, Great Slave Lake. On the basis of these and other dates, the Canadian Shield is divided into basement provinces separated by fault zones (Keewatin, Yellowknife, Athabaska, Labrador Coast, Great Bear, Grenville, Appalachian, Cordillera). Ages of pegmatites and lead ores are given for each province. Formation of the provinces, their faults, and associated orebodies are discussed.

1-

A review of literature and ideas on this problem. Most investigators found a reduced BMR for white individuals moving into, or living in the tropics. No

corresponding increase was found in man living in the Arctic, the high metabolic rate of the Eskimos being due to high protein diet and apprehension. Investigations in cold laboratories also failed to show an increase of BMR in man similar to that observed in animals. The effect of seasonal changes is also discussed.

Copy seen: DNLM.

48987. WILSON, OVE. Basal metabolic rate in the Antarctic. (Metabolism, clinical and experimental, Sept. 1956, v. 5, no. 5, p. 543-54, illus., table.) 82 refs.

A study of nine men during their two years' sojourn in the Antarctic and after their return home. The average BMR was -4.1 percent, -5.0 percent, and -4.9 percent in the three successive years. A significant seasonal trend was observed with peaks in the autumn and spring and a fall during the polar night; this periodicity is attributed to outdoor activity, cold exposure, etc. in fall and spring and to the sedentary indoor life during the polar night.

4895. WOHLSCHLAG, DONALD EUGENE, 1918- . Information from studies of marked fishes in the Alaskan Arctic. (Copeia, 1956. no. 4, p. 237-42, text map.) 14 refs.

Contains discussion of the results, possibilities, and technical aspects of mark-and-recapture studies in 1952 and 1954 of Coregonus sardinella and C. nasus kennicotti in fresh-water Ikroavik Lake, and C. sardinella and Myozocephalus quadricornis in a mile-long shallow tidal estuary of Elson Lagoon both near Point Barrow. Resampling (1954) indicated that the population of C. sardinella over 180 mm. long must have remained isolated in the lake, almost unchanged (5700) in

numbers and in uniform distribution, and retained the same level of annual mortality (ca. 0.59 per year). Likewise the population of *C. nasus* seemed to have remained constant (less than 600), isolated, with a very low mortality rate. The population of sculpin, *M. quadricornis*, in Elson Lagoon estuary (400 fish over 150 mm. long) was transitory and gradually filtered back into the lagoon. The studies were sponsored by Stanford University (1952) and the Arctic Institute of North America (1954) with the Office of Naval Research. *Copy seen:* DSI.

49001. WOOD, THOMAS H. Lethal effects of high and low temperatures on unicellular organisms. (Advances in biological and medical physics, 1956. v. 4, p. 119–65, illus., tables.) 79 refs.

A review and discussion of the action of high and low (below 0° C.) temperatures upon the destruction of unicellular organisms and their constituents, such as proteins, enzymes or nucleic acids. Selected quantitative studies are analyzed with the aim to find the factor responsible for the inactivation of the tested material. The literature on coldinactivation (p. 148-58) is selected primarily for the temperature range of 0° to -80° C. and includes viruses, bacteria, yeasts, erythrocytes, other cells, and cell

constituents. A discussion of experimental results, general conclusions, and suggestions for future research close this review.

Contains a systematic list of 75 freshwater algae, of which 50 belong to diatoms; they were collected in two areas in the western part of Ny Friesland in West Spitsbergen during the Oxford and Cambridge Expediion, 1951.

Copy seen: DLC.

49003. WOODRUFF, GEORGE A. Report of the physical land conditions in the Susitna River - Red Shirt Lake area. Palmer, Alaska, U. S. Dept. of Agriculture, Soil Conservation Service [May 1955]. 32 p. 41 plates, 4 maps (1 fold.), cross-section, 5 tables. Typescript. 5 refs.

Contains results of a land use capability survey by a six-man party (U. S. Soil Conservation Service-Alaska Agricultural Experiment Station), led by the writer, 1953-1954. Area discussed lies along the east bank of the Susitna River from its mouth on Cook Inlet at approx. 61°15' N. 150°40' W., north to approx. 61°50' N.; it is undeveloped except for small gardens; transportation and communication facilities are practically nonexistent. Soil and climatic conditions appear as favorable for crop production as in the Wasilla area to the east. Climate, soils, wetness, and flooding are briefly discussed; also surficial geology (by F. W. Trainer, U. S. Geological Survey). Land mapping symbols and the land use capability classification are explained; practices are recommended for each land use capability class in the area; climatic data are given for the village of Susitna and the Matanuska Agricultural Experiment Sta-Copy seen: DGS. 49005. WOODS HOLE, MASS., OCE-ANOGRAPHIC INSTITUTION. North Atlantic oceanography under Task Order I conducted during the period Oct. 1, 1955-Dec. 31, 1955. Woods Hole, Mass., Jan. 1956. ii, 12 l., unpub. ms. 5 refs. (*Its.* Periodic status report no. 38. Reference no. 56-11.)

Contains summaries of work conducted during the quarter Oct. 1-Dec. 31, 1955. A re-examination of the circulation of the Greenland-Norwegian Sea area was made and the traditional concept presented by Helland-Hansen was modified. The cyclonic eddy in the Norwegian Sea is much further west than previously described, being centered in the basin between Iceland and Jan Mayen. The Norwegian Current is very broad and spreads out over the deepest portion of the basin. The deep water of the Norwegian Sea (below 1,500 m.) with a temperature of 0.96° or warmer, is quite distinct from that of the core of the Greenland Sea eddy which has deep temperatures of  $-1.00^{\circ}$ The Norwegian Sea, not the or colder. Greenland Sea, is believed to be the source of Polar Deep water. An analysis and interpretation of results of experiments on the Northern and Southern Hemispheres were made with an eightfoot rotating model.

49006. WOODWORTH, RALPH W. Arctic surveying. [Washington, D. C.] 1956. 3 p. 1., 10 p., 2 text maps. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, no. 2.) 16 refs.

Contains a discussion of some of the general problems encountered in surveys of land and water areas of the Arctic; such surveys are not difficult but winter work is reduced to a minimum. The selection of proper transportation is the most important problem. Field methods and instrumentation are similar to those used in temperate regions. Progress made by the U. S. Coast and Geodetic Survey in Alaska in triangulation and hydrography through 1956 is mapped.

49007. WOOLLARD, GEORGE PRIOR, 1908-, and others. The establishment of an international gravity standard. (American Geophysical Union. Transactions, Apr. 1956. v. 37, no. 2, p. 143-55, diagrs., tables, text map.) 9 refs. Other authors: J. C. Rose and W. E. Bonini.

Describes a program of pendulum and gravimeter measurements for the establishment of a gravity standard between Mexico and Alaska. The northern terminus selected was at Fairbanks, Alaska, with the route following the Alaska Highway from Edmonton to Fairbanks. Included in the Gulf pendulum bases are Whitehorse, Fort St. John, Edmonton, and Fairbanks. Problems involved in obtaining precise measurements with pendulums are discussed, values for three independent sets of pendulum measurements and gravimeter measurements are compared.

Plans call for a new line of measurements from Thule, Greenland, down the east coast of South America to Cape Horn, an extension of the Alaska-Mexico line down the west coast of South America, and a new line from the Aleutian Islands along the east coast of Asia through Australia to the Antarctic. Two stations are contemplated for ice islands in the Arctic Basin. Gravity measurements will be made by Arctic Institute of North America parties in the Antarctic as part of the glaciological program.

49013. WRIGHT, WILLIAM GREEN-WOOD, 1831- . The butterflies of the west coast of the United States, with colored figures and descriptions of many new species and new varieties now first published. Ed. 2. San Bernardino, Calif., Pub. by the author, 1906. 257, vii p. port., 32 col. plates (940 figs.) First pub. in 1905.

Contains notes on general features of butterflies, a complete list of those in the United States, and (p. 70) 29 forms of new species described by the author. A systematic list follows of 487 species with brief description and illus., also data on habitat food plants, and distribution. Some species native to Alaska are included. Copy seen: DLC.

49014. WUSTMANN, ERICH, 1907- . Isbjörn; wo Männer und Eisbären sich begegnen. Radebeul, Neumann Verlag [1955] 154 p. illus., plates. Text in German. *Title tr:* Isbjörn; where men

and polar bears meet.

Popular sketches of arctic wildlife in the form of a story about the polar bear "Isbjörn" and its wandering in area of Greenland Sea between Svalbard and Greenland: seals, walrusses, sea lions, birds, fishes are described; also Swedish, Norwegian, Newfoundland and Eskimo hunters, their huts, equipment and dogs. The polar bear's search for food and its encounters with men and dogs, etc., are recounted. Illus. by excellent photographs and drawings. Copy seen: DLC.

49015. WUSTMANN, ERICH, 1907- . Klingende Wildnis; Erlebnisse in Lappland. Eisenach, E. Röth, 1956. 142 p. illus. 15 refs. Text in German. Title tr: Ringing wilderness; experiences in Lapland.

Author and family spent several years

among the Swedish Lapps, whose language he speaks. He describes their way of life and mentality, and his own work: the recording and study of folk songs, both text and music, and their meaning and origin. Songs (77) are presented in Lappish with German translation and some (19) melodies reproduced. Some of the latter originate from other Lapp areas. Copy seen: DLC.

49016. WYATT, WILLIAM H. Strong surface winds at Elmendorf AFB, Alaska. Nov. 9, 1956. 3 l., 24 maps. 3 refs. (U. S. Air Force, 7th Weather Group (MATS). Technical memorandum no. 18.)

Synoptic situations leading to strong surface winds at this base on Dec. 18, 1955 and Feb. 18, 1956 are described and illustrated. Strong winds have been recorded in every month of the year. A typical synoptic pattern leading to such wind conditions features a deep low over the Gulf of Alaska and high pressure over the interior of Alaska. Brief hints on forecasting these conditions are included. Copy seen: DAWS.

WYLIE, R. G., see Cass, M. H., and others. The induction and control of hypothermia. 1956. No. 44295.

49017. WYLLIE, P. J. Ice recession in Dronning Louise Land, NorthEast Greenland. (Journal of glaciology, Oct. 1956. v. 2, no. 20, p. 704–708, 2 illus. (p. 709), text map.) 3 refs.

Results of observations during British North Greenland Expedition 1952–1954. "The effect of high rock thresholds in the W. part of this area on the glacier recession is discussed. These barriers restrict the flow of ice from the icecap. Evidence is presented to show that the recession of the glaciers is controlled, in the final stages, by the thinning of the icecap and the consequent emergence of rock thresholds. It is possible that many of the glaciers of E. Greenland have similar barriers at the icecap margin. If so, starvation of the glaciers by being cut off from the icecap may be a more important factor in recent recession than has been recognized."—SIPRE.

49018. WYNN, VICTOR. The metabolism of fructose during hypothermia in man. (Clinical science, 1956. v. 15, no. 2, p. 297–304, illus., table.) 24 refs. Disappearance of injected fructose from the blood during hypothermia of 28.5–30.5° C. was found to be greatly impeded, which is assumed to be due to its reduced penetration into the cells. Subsequently plasma glucose rose sharply. Large injection of insulin had little effect upon this apparent conversion of fructose to glucose. This behavior of carbohydrate metabolism is analyzed and discussed.

49020. WYSZECKI, GÜNTER. Theoretical investigation of colored lenses for snow goggles. (Optical Society of America. Journal, Dec. 1956. v. 46, p. 1071–74, illus. table.) 12 refs.

Account of investigation aimed at finding a kind of glass which would make crevasses, fissures, ditches, etc. more visible. Safe driving or skiing in a snow field depends frequently upon early detection of changes in elevation, especially difficult under overcast sky when the entire visual field seems of the same whiteness ("arctic whiteout"). Four basic types of danger areas are considered: ditch, crevasse, step and spherical depression; and the "step" is found to be the most dangerous as far as detectability goes. No specific color of glass for absorbing lenses is found likely to improve visibility of these obstacles during Even red glasses, which according to theory should give maximum improvement, were found to be not better than neutral glasses.

49021. YAMAJI, KENJI, and D. KUROIWA. Study of elastic and viscous properties of snow by the vibration method I. (Teion-kagaku, Low temperature science, Sapporo, 1954, ser. A, no. 13, p. 49–57, illus., graphs, diagr.) 5 refs. Text in Japanese. Summary in English.

"The results of preliminary experiments with a rectangular sample of old snow are reported and data are graphed. Young's modulus was determined to be of the order of 10° (C. G. S.), increasing with density and decreasing temperatures. The vibration loss was about 10³ at low temperatures and 10⁵ near the m. p., showing a tendency to increase with decreasing density. The activation energy, as estimated from the temperature characteristics of the internal viscosity coefficient, was 12.3–18.3 kcal./mol."—SIPRE.

49022. YOHE, RALPH SANDLIN. Norway is developing the agriculture of its north land. (Foreign agriculture, Oct. 1953. v. 17, no. 10, p. 183–87, 2 illus.)

Recounts impressions from an auto journey to northern Norway: differences between farming conditions there and in lower latitudes, work of the Holt experiment station at Tromsø, seed problems, etc.; a general survey is given of the scope of the north Norway agricultural development program.

Copy seen: DA.

49023. YOSHIDA, JUNGO. A quantitative study on the metamorphosis of snow crystals. (Teion-kagaku, Low temperature science, Sapporo, 1954, ser. A, no. 13, p. 11-28, illus., graphs, diagr.) 5 refs. Text in Japanese. Summary in English.

"The smoothing of snow-crystal surfaces and the evaporative thinning of dendritic snow-crystal branches in the attachment regions during metamorphism are analyzed mathematically. The analysis indicates that vapor-tension differences responsible for thinning and smoothing are not due to curvatures nor to elastic stresses in single crystals but to stresses appearing in masses of crystals overhanging snow layer. A value of less than 1 hr. was calculated for the time required for elastic stresses to act on a rod-like ice crystal 0.1 mm. in diameter and 0.35 mm. long standing on edge in a layer of similar crystals 0.3 gm./cc. in density and 40 cm. thick projecting 50 cm. horizontally over an edge. Elastic stress is effective only on ice grains of small diameter, since its effect reduces rapidly with increasing grain diameter, proportional to the 8th power of radius."-SIPRE. Copy seen: DLC.

49024. YOSHIDA, JUNGO. A study on the determination of liquid water content of snow by centrifuge. (Teionkagaku, Low temperature science, Sapporo, 1955, ser. A, no. 14, p. 55–75, illus., table, diagrs., graphs.) 4 refs. Text in Japanese. Summary in English.

"A method of separating liquid water from snow is described, and the results obtained are analyzed. Snow samples were placed in a fine-mesh wire cylinder and rotated in a collector with sloping walls at a constant temperature of 0° C. The water drained into an annular groove at the bottom of the collector. The performance of the centrifuge was tested by adding a known quantity of water to dry snow. From 60-70 percent of the water was separated in the first min. of rotation, decreasing to a constant rate of 0.1 cc./min. after 5 min. The rapidity of separation depended on the distribution of water in snow channels and the centrifugal force acting on it."-SIPRE. Copy seen: DLC.

49030. ZAGŪ, A. Dizel'-ėlektrokhod "Ob'." (Morskof flot. Mar. 1956. t. 16, no. 3, p. 15–19, illus., drawing.) Text in Russian. Title tr.: Diesel-electric icebreaker Ob'.

Description and construction data for the ship and its equipment are given in detail with cross-section, deck plans, etc. The vessel has 12,600 tn. displacement, length 130.2 m., width 18.88 m., draft (in ice water) 7.62 m. The diesel-electric installation develops 7000 shaft hp. at 15.5 knots. The output of four main diesel generators is 5568 kw. with 400 volts of D. C. current at speed 360 rpm. The generators are directly driven by two-cycle, 8 cylinder, non-reversible Zulzer Diesel engines. The propeller's electric motor is operated with 800 volt D. C. current, and is connected in series with two main generator units. Fuel capacity for 15,500 miles. The sufficient welded hull has reinforced ice-breaker construction with specially strong icecutting bow, water-tight bulkheads and double bottom. Copy seen: DLC.

49031. ZAGOSKIN, LAVRENTIÏ ALEKSEEVICH, 1808–1890. Puteshestviß i issledovaniß leitenanta Lavrentiß Zagoskina v russkoï Amerike v 1842–1844 gg. Moskva, Gos. izd-vo geogr. lit-ry, 1956. 453 p. illus., plates, ports, maps (1 fold. in pocket) over 100 refs. Text in Russian. Title tr.: Travels and explorations of Lieutenant Lavrentiï Zagoskin in Russian America in 1842–1844.

Zagoskin's works relating to his travels in Alaska are reprinted, viz: Peshekhodnaîa opis', 1847, (cf. No. 19781) p. 32-322; meteorological observation tables are omitted, but illustrations are added, among them photographs (16 plates) of ethnographic objects collected by Zagoskin in Alaska and preserved in the Academy of Sciences and Moscow University. Articles on Siberia and Russian America, originally pub. in 1840-49 (p. 325-81). Four of them, with the title Zametki zhitelia togo sveta (Notes by an inhabitant of another world) (p. 325-72), reprinted from the magazine Matak, 1840-41, give a description of Zagoskin's journey from Petersburg to Alaska via Yakutsk and Okhotsk.

Biography of Zagoskin by M. B. CHERNENKO which opens the volume (p. 5-40) and a sketch of Zagoskin as explorer of ethnography in Alaska, by B. LIPSHITS (p. 385-98) appear in this Bibliography under these authors' names. Appended (p. 399-452) is a bibliography of Zagoskin's works and of works about him; a glossary of special local and obsolete terms which he used; indexes of personal and geographical names; and a brief description of his ethnographic collections. Copy seen: DLC.

49038. ZARROW, MYER X., 1913—, and M. E. DENISON. Sexual difference in the survival time of rats exposed to a low ambient temperature. (American journal of physiology, Aug. 1956. v. 186, no. 2, p. 216–18, illus., table.) 13 refs.

In rats exposed to a temperature of  $2\pm 2^{\circ}$  C., sexual dimorphism in survival time appeared at the age of 60 days and was also observed in animals 120 days old. In both cases females survived much longer than males. Castration had no effect on females but prolonged the life of males. Estradial had no effect and testosterone proprionate shortened survival time. Copy seen: DNLM.

(Ministerstvo vysshego obrazovanita SSSR. Latvitskii gos. universitet. Botanicheskii sad.) 80 refs. Text in Russian. Title tr.: Search and introduction into culture of new medicinal plants.

Development of phytotherapy and cultivation of new medicinal plants in the U.S.S.R. are outlined (p. 5-15), and three such plants treated in detail (p. 16-112). Their pharmacological properties, botanical descriptions, cultivation. uses in popular medicine and in pharmacology are presented. Polemonium caeruleum, grows wild in Novaya Zemlya, Siberia and Alaska, its roots are used as a sedative and as a substitute for senega (Polygala senega) as an expectorant. Anisodus (Scopolia) luridus, known also as Himalayan scopolia, introduced from Nepal, is cultivated in northern European U. S. S. R. as a source (roots) of various alcoloides of the tropan group, chiefly for the manufacture of atropin and scopolamine. Erysimum canescens, a biennial cruciferous herb, grows wild in European U. S. S. R. and eastern Siberia, and is used (leaves) chiefly as heart stimulant. Copy seen: DLC.

Two types of Portland cement were selected for study: one with 9.5, the other with 6 percent tri-calcium-aluminite dissolved in different solutions of NaCl and CaCl2. Concrete made with the first cement was subjected to tests in a cold room at -20° C. during periods varying from 60 to 120 days; that with the second cement for 75 to 125 days under natural winter conditions. Results are tabulated and the temperature variation graphically shown. Specimens of both concretes were also tested under cyclic variation (100) of freezing and thawing conditions. The frost-resisting property varied with the concentration of ingredient and with the thermal condition of hardening, which are given in detail. Copy seen: DLC.

49049. ZHELEZNODOROZHNYĬ TRANSPORT. Svoevremenno zavershit' podgotovku transporta k otlichnof rabote v zimnikh usloviâkh. (Zheleznodorozhnyĭ transport, Sept. 1956. god 38, no. 9, p. 3-7). Text in Russian. Title tr.: Well-timed preparation of transport facilities for efficient winter work.

Editorial appeal to local railroad administrators and workers to speed up preparations against severe winter conditions, as snow drifts are more easily prevented than removed. During the previous winter, snow removal operations required 1,100 locomotive-days, 200,000 men and cost 300 million rubles. By 1960, it is planned to build 660 new heavy-and medium-duty snow removers, expand the planting of shelter belts and erection of snow shields along railroads.

ZINOVA, ANNA DMITRIEVNA, see Zinova, E. S. Vodorosli . . . Ledovitogo okeana. 1956. No. 49066.

49066. ZINOVA, ELENA STEPA-NOVNA, 1874–1942. Vodorosli Severnogo Ledovitogo okeana. (Akademiña nauk SSSR. Botanicheskii institut. Trudy, ser. 2, Sporovye rasteniîa, 1956. vyp. 11, p. 39–51.) Text in Russian. Title tr.: Algae of the Arctic Ocean.

Contains a systematic list of 39 species and 13 forms (in 23 families and 27 genera) of blue-green (Cyanophyta), green (Chlorophyta), brown (Phaeophyta) and red (Rhodophyta) marine Based on collections in various arctic waters: Severnaya Zemlya (Domashniy Island), Vize Island (79°31' N. 76°41′ W.), Franz Josef Land, Malyy Lyakhovskiy Island (Laptev Sea), Russkaya Gavan' on Novaya Zemlya, also a few other localities. Synonyms, descriptive notes and data on habitat and distribution are given. This posthumous paper was prepared from the unfinished manuscript by A. D. Zinova.

49067. ZISSER, VLADIMIR PAVLO-VICH, 1895–1955. Razvitie okhotnich'ego khozíalstva v Chukotskom natsional'nom okruge. (Ratsionalizatsifa okhotnich'ego promysla, 1956, vyp. 5, p. 65–70, tables.) Text in Russian. Title tr.: Development of the hunting industry in the Chukotsk National District.

The area of this northeasternmost district in the U. S. S. R. covers 711,000 sq. km.; 76.3 percent of it tundra, and the remainder tundra forest and taiga. Hunting and trapping of arctic fox (76

percent of the total catch), squirrel, ermine, fox, otter, wolverine, wolf, snow hare, elk, and wild reindeer, also of recently acclimatized muskrat and sable, play a significant role in the district economy. Tabular data are offered on hunters' equipment and their catch in the Kolyma and Chukotsk regions; also on the ratio of collective farms' income from hunting and from other sources. Means of furthering the hunting industry are discussed: collectivization, improvement of transport, increase in prices for delivered furs, and better supply of equipment, sled dogs, etc.

49068. ZITEK, RUDOLF von. Wenn Wasser zu Eis wird. (Orion, Feb. 1956. Jahrg. 11, no. 3-4, p. 121-25, illus.) Text in German. *Title tr.:* When water turns into ice.

Contains information on water temperature and specific weight; freezing, and its effect on rock weathering and soil formation; perennial ice, permafrost, and other forms of ice; glaciers; etc.

Copy seen: DLC.

49069. ZIZA, ANDREĬ ANDREEVICH. Kompleksnoe ispol'zovanie torfûnykh bolot v sel'skom khozfalstve. (In: Akademiûn navuk BSSR, Minsk. Instytut meliûratsyi, vodnat i balotnaf haspadarki. Trudy, 1953. t. 2, p. 101–110, tables.) Text in Russian. Title tr.: Maximum utilization of peat bogs in agriculture.

Contains information supplemental to author's Torf v sel'skom khoziātstve (No. 43443) on peat and its combinations as fertilizers for various crops planted in an experimental field: barley, oats, cabbage, carrots, beets, etc. Copy seen: DLC.

49070. ZIZA, ANDREĬ ANDREEVICH, and M. N. NIKONOV. Sel'skokhozſaīstvennoe ispol'zovanie torfſanykh bolot. Moskva, Gos. izd-vo sel'skokhoz. lit-ry, 1955. 183 p. illus., tables, diagr. Text in Russian. *Title tr.:* Agricultural utilization of peat bogs.

Genesis of marshland (also formation of peat moss) is briefly described; its distribution in the U. S. S. R. and agrochemical characteristics are shown (map and tables 1–5). Drainage system and mechanized equipment for various operations are described with illus. (p. 41–59). The uses of different peat soils for specific crops of peat moss as fertilizer are explained with reference to their agro-

chemical and physical characteristics (p. 59-140, tables 7-21). A mixture of manure and fibrous peat is used as biological fuel in hothouses, the thermal reaction of which sustains a high temperature for a long time. Mass production of humus peat pots for forcing vegetables is described (p. 149-50), also other agro-technical applications of peat.

49077. ZOLOTAR', M. L. Razvedka Takhtarvumchorrskogo mestorozhdenifa molibdenita. (In: Khibinskie apatity, 1933. t. 6, p. 139–41.) Text in Russian. Title tr.: Investigation of the Takhtarvumchorr deposits of molybdenite.

Geological and mineralogical characteristics of molybdenite deposits are described. The central part of the pegmatite has economic possibilities with a greater concentration of the molybdenite, than the border zones. Approximate capacity of deposits of categories A2, B and C is about 143,000 tons of metallic molybdenum. Survey of this region is continued by underground work in veins of the first and second cirque and by specific search in the vertical walls of the cirque.

49078. ZOLOTUKHIN, A. A. Direktivy XX s''ezda KPSS po shestomu pfatiletnemu planu i zadachi gidrometsluzhby. (Meteorologifa i gidrologifa, Sept. 1956, no. 9, p. 3–11.) Text in Russian. *Title tr.:* Directives of the 20th Congress of KPSS on the sixth fiveyear plan and hydrometeorological problems.

The program proposed by the Communist Party of Soviet Union for 19571961 is reviewed in respect to improvements in hydrometeorological services and observations, including those in the Arctic. Extension is recommended of the hydrological net in the Ob', Yenisey, Lena, Amur and other basins, specially for observation of spring run-off, summer floods, precipitation, temperature fluctuation, etc. Suggestion is also made for improvements: in hydrometeorological services in the North Atlantic for the fishing industry and the Navy; in weather and ice boundary forecasts for the Barents, Bering and Okhotsk Seas. especially in fishing zones. Methods of forecasting and work of weather station personnel in Central Siberia, including Yakutsk, must be improved; their facilities must be increased and 300 new hydrometeorological stations, 1450 new observation posts and 600 hydrological points included in the hydrometeorological system for large water reserves. Methods for more uniform and systematic recording of data must be changed also to meet requirements of the automatic computing technique for speedy publication of data. Attention should be given to the development of theory on climates, thermal balance in the atmosphere and surface layer; on physics of clouds and precipita-Special research is recommended for IGY. in the field of atmosphere circulation; three-dimensional analysis of atmospheric conditions in a large space; study of physical phenomena in the troposphere and stratosphere; in variation of ocean currents; thermal and chemical conditions of sea water, etc.

49079. ZOTOV, P. P. K mineralogii lovehorritovykh mestorozhdenif. (*In:* Khibinskie apatity, 1933. t. 6, p. 112–14.) Text in Russian. *Title tr.:* Mineralogy of the lovehorrite deposits.

Mineralogy of two veins in the Yukspor ridge is analyzed. Size, composition, location and arrangement of deposit components are noted: minerals identified are feldspar, aegirite with hornblende, lovehorrite and nepheline, in addition to apatite, astrophyllite, sphene, sphalerite, galena, lepidomelane, eudialite, rinkolite and morphological and mineralogical natrolite. Difference in contents of the two veins is attributed to one being in a 150 m. lower position than the other. Erosion of the lovehorrite in this region is found to be of considerable magnitude.

49080. ZSÓTÉR, TAMÁS, and M. SZABÓ. Érreakciók potenciált narkosis és hypothermiában. (Kísérletes orvostudomány, 1956. 8 évfolyam, no. 3, p. 237–42, illus.) 17 refs. Text in Hungarian. Summaries in Russian and German. Title tr.: Blood vessel reaction during potential narcosis and in hypothermia.

Account of observations on the vessels of the mesoappendix of the rat. In cases of hypothermia there was no reduction of vasal activity, not even at a rectal temperature of 25° C. Other blood vessel areas appear to show similar behavior.

\*\*Copy seen: DNLM.\*\*

49081. ZSÓTÉR, TAMÁS, and M. SZABÓ. Vasoreaktionen in potenzierter Narkose und Hypothermie. (Zeitschrift für die gesamte experimentelle Medizin, 1956. Bd. 127. Heft 2, p. 113–20, illustables.) 18 refs. Text in German. Title tr.: Vasal reactions during potentiated narcosis and hypothermia.

Report of an investigation on the vascular reaction in the mesoappendix of rats in potentiated narcosis or a  $\pm 28^{\circ}$  C. hypothermia. During the latter no fall of vascular activity was observed following administration of adrenaline, noradrenaline, pitressin or barium-chloride. Copy seen: DNLM.

49082. ZUBĪĀN, G. D. Planetarnafa frontal'nafā zona v nizhnel stratosfere. (Meteorologifā i gidrologifā, Sept. 1956. no. 9, p. 12–21, table, maps, charts.) 10 refs. Text in Russian. *Title tr.:* Planetary frontal zone in the low stratosphere.

Account based upon an analysis of temperature fields on the isobaric surfaces of 500, 300, 200 and 100 mb. and upon vertical profiles, all made during May 1955, in the Northern Hemisphere. It is concluded that the weather fronts frequently penetrate into the lower stratosphere where they create similar synoptic changes. The significance of this condition for rain formation and for aviation is pointed out.
